From: IZ7AUH Frank
Topic: 3475 Message: 3475

Hi Guys,

i need your help, I have an ACOM 1000 and two radio IC7600 and FLEX-3000

I can make a dual PTT-in cable a Y-cable with 2 PIN for IC7600 and FLEX3000
and one for PTT-in of ACOM?

Or dangerous?

Many tnx HNY to ALL

Sincerely and 73,

FIRMA-FRANK1

Frank,
I do exactly what you are proposing. I have a Flex 5KA and an Icom IC-7700 and I have two amps, a Tokyo High Power and an Acom 2KA. Since the keying is via relays (note that I made a keying relay for the Flex) and I only use one amp and one rig at a time when either rig activates its keying relay the selected amp is keyed.

3477. RE: [acom-list] DUAL PTT-In

Yahoo group: acom-list (2010 — 2016)
Date: 2010-01-03 22:15:29 UTC
From: Geir Tore Christiansen
Topic: 3475 Message: 3477

You most probably have a switch for the RF input to the Acom, so why not another one for the PTT ?

Most elegant would be a coax relay and a key relay driven by same switch.

Geir/LA5ZO

3478. Re: [acom-list] DUAL PTT-In

Yahoo group: acom-list (2010 — 2016)
Date: 2010-01-04 07:07:51 UTC
From: Hans Remeeus
Topic: 3475 Message: 3478

As the Acom 2000A does not feature dual rig and/or dual antenna I made
something myself.

You can see the results on
http://www.remeeus.eu/amateur-radio/antennes-en-antennetuners/ab-schakelkastje.html
It is in the Dutch language, however Google Translate may help you
translating it into your own language.

My IC-7700 has ANT1 - ANT4, of which I use ANT1 and ANT2.

For about 40 euro I have the following features, with the A/B-switch
very close to the rig:

A1: ANT1 with DeltaLoop + linear and ANT2 with Vertical, or:
B1: ANT1 with Vertical + linear and ANT2 with DelaLoop.

Or:

A2: ANT1 with Vertical + linear and ANT2 with DeltaLoop, or:
B2: ANT1 with DeltaLoop + linear and ANT2 with Vertical.

I found this very useful, especially during (multiband) contests, where
fast switching can be very important.

The switchbox is tested with more than 1.500 kW on the dummyload.

Together with ANT1 and ANT2 I use RX-I/O with Perseus SDR as second
receiver (in combination with BobCAT and Tmate).

3480. Mains voltage for Acom 2000A

Yahoo group: acom-list (2010 — 2016)
Date: 2010-01-15 11:47:24 UTC
From: ik2typ
Topic: 3480 Message: 3480

Hello.

In the last two months I have noticed the HEATER led was blinking very often, one day that it was always blinking, I've checked the main voltage it was 236 Volts,

suddenly went to "PROT" while the RCU was on standby mode, and a message issued on the RCU display (DC motor voltage too high 48,8V).

The internal setting into the amplifier is 220 Volt.

I have to say that a week ago I also had on my PC station, a motherboard crash, and the new computer sometimes at start stopped after showing the motherboard logo not able to go haead anymore, as the oldest one did many time before crashing. .

So, in order for a better protection for the whole stuff in the radio station I have mounted an appropriate AC stabilizer of 7.5 KWA with an out of 220 V. AC

Now everything work very well, but I am still surprised because 236 Volts isn't more than 7,5% . of nominal's 220V

Fede, IK2TYP

Hello Fede,

If the Voltage is so close to 240 Volt (in your situation 236 Volt)
personally I would prefer the 240 Volt setting of the 2000A.

However; with the 220 Volt stabilizer you have made a good solution. Is
it 7.5 kWA or 7.5 kVA?

CIao Fede,

I had the same problem as you described. By following Hans' suggestion I had no problem (I didn't need
the any AC stabilizer).

3483. ACOM 2000A RCU voltmeter revisited

Yahoo group: acom-list (2010 — 2016)
Date: 2010-01-19 03:50:24 UTC
From: kamarty456
Topic: 3483 Message: 3483

A while back I indicated a significant variance between my 240VAC line voltage and the mains voltage displayed on the RCU [remote control unit]

I finally opened the amp and adjusted the voltmeter to read the same as the digital voltmeter reading at the 240VAC outlet.

Well over time I'm noticing the RCU mains voltage has drifted and no longer is a slave to my outboard meter. For now I'm not too concerned as the readings can be dead on or +/-2VAC.

I never did get any answers to the question about the mains voltage reading VS the heater voltage... As the mains voltage would increase from say, 241-VAC to 246VAC the heater yellow LED would flash and when looking at the heater voltage display it would read 13.1 to 13.4V

As the mains voltage would settle down to say 243VAC the Acom RCU would display 243 to 245VAC and the heater voltage from 13.1 to 13.3V

Is there any relationship between the two voltmeter indications? I prefer not to be poking around to measure the heater voltage and calibrate the heater voltmeter.
I understand that as the 240VAC line voltage varies so too with all parameters. But...the line voltage is a solid 240VAC to maybe 243VAC

so..if the Acom is displaying a higher line voltage than what is actual, is it effecting all parameters or is it simply the voltmeter error?

3484. Acom 2000A Low G2 Voltage

Yahoo group: acom-list (2010 — 2016)
Date: 2010-01-20 18:49:23 UTC
From: Edward
Topic: 3484 Message: 3484

First post here. I am about to buy a used Acom 2000A next week from the widow of a SK.

The 2000A has been off the air for about 2 1/2 years. When I first powered it up and selected "operate" it gave a "low G2 voltage error". I then cycled the "operate/standby" again and it did not give an error.

I've read all the other posts here about the issue possibly being a tube, varistor, or RS-232 connection.

Should I be concerned? Is the repair likely to be costly? I know the price of tubes if that is the issue but aside from tubes is it likely to cost a lot to repair, if needed?

I am very technically adept and can do the repair myself if that is an option.

Thanks in advance for any thoughts and I look forward to learning and contributing to this group in the future.

73,

Mack de WB4MAK

Hi Edward,

After 2 1/2 years off the PSU electrolytics could have been a bit leaky (passing current) and needed reforming. Once it's been on for a while that should be fixed.

I would, however, increase the on time slowly just in case any leakage current caused heating, a cap blow up is messy. Maybe 10 minutes on, rest, 20 minutes on, rest, one hour on, thereafter OK. You may well be beyond that stage already though.

Regards,

Mike VP8NO

Good technical answer from Mike. On the business side, Acom US goes out of their way to be helpful. Everyone on the reflector here has a positive story to tell about interactions with Will or the team in LZ. If it turns out that you need to make a repair and you'd like to do it yourself, I think you can expect to get a helpful level of encouragement and assistance from Acom.

3494. Question on Tubes Please 4CX800

Yahoo group: acom-list (2010 — 2016)
Date: 2010-01-31 13:53:07 UTC
From: Mack WB4MAK
Topic: 3494 Message: 3494

I am the second owner of an Acom 2000A that is working great in every aspect but I do have a few questions. It produces full power with no errors or protection faults.

1. What is the life expectancy of the 4CX800's? I know this is a question with a lot of variables but I'm just trying to get some benchmarks. I do have a second set on order from Vine Antennas thanks to the advice of this list.

2. I understand that you should not cycle the heaters on and off more than necessary as that is a source of failure. What are some general guidelines? Let's say that I have three nets today at 9 AM, 2PM, and 3 PM. Should I turn off the heaters between 9 AM and 2 PM or is it better just to leave them on?

3. What are the major indications you receive when the tubes need to be replaced? Is there a way to check the tubes while in the amp?

Thanks in advance. I own a lot of tube equipment but I'm just trying to get specifics related to these tubes and amp.

73,

Mack de WB4MAK

Mack,

As I told you previously, you probably will not need to purchase spare tubes - ever. Some tubes do get away from the factory with a defect that shows up pretty quickly but most are like mine (and apparently yours) that keep on working for a long time with no trouble. Mine have been in heavy use since 1997 - nearly every major contest over that span including SSB, CW and RTTY - with numerous operators and no damage aside from the vacuum relay going out after about 10 years of heavy usage. Note - this was not doing QSK the whole time. With QSK, the vacuum relay will likely not last as long.

You can leave the amp on all day if you like and it will not make any difference to the life of the tubes. You could turn it off after your morning net and turn it back on in the afternoon and make no difference to the tubes - just remember that you have the warm-up period, so you'll have to turn it on several minutes before you want to use it at 2pm.

What kind of a deal did Vine give you on the tubes? I hope it was a lot better than our price since we have them in stock right here in the U.S.

73,

Bob W5OV

3496. Question on Tubes Please 4CX800

Yahoo group: acom-list (2010 — 2016)
Date: 2010-01-31 14:30:20 UTC
From: Hal Kennedy
Topic: 3494 Message: 3496

At the risk of jumping into what seems to often be controversial, here are a few thoughts and data points:
1. The rating of the tube life by Svetlana is >2500 hours. I am unaware of any failing sooner than 2500 hours. Many are still running fine at 10,000 hours or more. Tom (sk), of Tom's tubes, who probably sold more of these than anyone else; used to suggest 3500 hours average. I think the number is closer to 5000-7000 hours average, but it depends a lot on how you use/abuse them. If you use auto-tune and run more than 1500W output, you can destroy the tubes quickly. 5000 hours of RTTY contesting is not the same as 5000 hours of sitting listening to a net.

2. If the temperature of the two tubes while running hot is off by a lot more over time than it was when they were new, that's a sign one is going soft. This usually is not the failure mode. The most common failure mode is a grid short. Your amp will either trip out or fail to start with error codes indicative of a grid short.
3. We are all warned of turn-on cycles potentially failing the filaments. Just like a light bulb - they tend to go at power on. Unlike a light bulb, your amp has step start, to soften the shock of power up. I am unaware of any of these tubes ever failing with an open filament. Anybody ever seen one? It would be helpful to know under what conditions it occurred. Power-on does shock the tubes some, so I would leave your amp on for the two afternoon nets, but probably turn it off if I was off the air more than 3 hours.
4. Other than checking the operating temperature, there is no way to check the tubes inside the amp. If you get 1500W out for 50-60W in, into a 50 ohm load, both tubes are fine. The amp checks the tubes continuously. Your best source of data is an error code - but you get no warning.

Enjoy the amp and forget the tubes, and don't overdrive it!

73,
Hal

Thank you to everyone who responded with some great insights. I think I was over-thinking the tube thing.

Two people asked what the tubes cost from Vine Antennas. They were 300 GBP. I ordered from them ONLY because I just returned from London and had a pocket full of pounds that I was looking to unload.

Thank you to everyone for all your advice. I used my amp for about 20 hours on the 160M contest this weekend and it performed flawlessly.

73,

Mack de WB4MAK

Hi Mack,

I had a tube fail at 6100 hours with a grid-cathode short. Cut the tube apart. You can see how the cathode insulating coating was not applied to the top of the cathode. And that is where it looks like the short occurred. I would think these tubes should last at least 10K hours unless there is a problem n the manufacturing such as what I experienced.

The days when I think I will need the amp I just leave it on. Many times I forget about it and leave it on for many days at a time. In my case the amp is hung from the basement ceiling about 2 feet below my feet. I just have the RCU in the shack. If you want to cycle it I can't think of any reason not to other than waiting the 3 minutes warm up time.

In regards to the temperature variations from tube to tube, with heavy use such as in a contest I like to see only several degrees difference between the tube temperatures at around 70 degrees or higher temp. My present set of tubes vary by about 4 degrees. Got a few sets of NOS on eBay a few years back that seem to work well. Now I hear you can get them from some US and European stores.

Well I guess the time to change tubes is when you get a grid to cathode short alarm (make sure it is not a low voltage power supply problem), or you can't get full output with 100W drive (should only take 30-60w). Other than that, let it cook.

Good luck with the amp. I have been quite happy with mine for over 10 years. And the support form Acom has been quite good.

73,

N2TK, Tony

You can but with amateur radio, things have to be difficult. Call up ACOM as just ask for a few extra screws. After spending nearly $7,000 do you think ACOM will say no.

3506. Replaced Tubes Today: Heater Reset Proceedure

Yahoo group: acom-list (2010 — 2016)
Date: 2010-02-03 00:59:11 UTC
From: Mack WB4MAK
Topic: 3506 Message: 3506

Today I successfully replaced the tubes in my Acom 2000A. I followed the very thorough instructions including resetting the plate currents.

Please advise if there is a way to reset the heater run time without doing a "complete" reset of the amp. I guess if that's the only way then I'll just have to set up all the USR setting again.

Thanks and loving this amp and very helpful list!

73,

Mack de WB4MAK

When my pressed in nuts for the screws (We Buy them as "PEM NUTS here in USA) were coming loose or
fell out, I used a metal Epoxy to hold them back in place after squeezing them back in for
a pliers...I don't know what the mechanical design guy was thinking the day he selected those as
they need to be 1 size screw larger !!!

G'day,

Do detailed instructions exist for the replacement of the single tube in the Acom 1000. I'm not planning on doing it any time soon but if there are any adjustments to be made i.e. standing current then it would be useful to have them in the file.

Regards,

Mike VP8NO

And come out, never to go back in again!

They're called pem nuts. There's a fix for them, sort of. I asked Stan at Acom what to do about the three or four of mine that have fallen out. He emailed instructions on how to use a pop rivet tool to press the nut back in again. Basically, you push the shaft of a pop rivet through the pem nut and hole in the case, position the pem nut squarely in the hole, and slip the pop rivet tool over the end of the shaft. As you use the tool to pull the shaft, the head of the rivet collapses and presses the pem nut into the hole with considerable force.

However, I found that if the hole has widened sufficiently for the pem nut to fall out, it's unlikely that it will stay in after being pressed in again. Stan anticipated this, and offered to send me some pem nuts with a slightly larger collar. The nuts are metric size and made in Europe. I tried to find them in the US, but could not. Been meaning to write to Stan to get some. Of course, once the holes widen from torquing the screws into the larger pem nuts, an even larger pem nut will be required! Bad design? Oh, yeah!

One last thing: there are some holes where it's impossible to position the rivet or rivet tool. Some can be accesses by partially disassembling the amp. It looks like others would take a lot of disassembly.

There are so many screws that I feel confident the case is as RF tight as it can be. So, it's not a high priority -- yet.

Just use a metal epoxy after cleaning surfaces well

Just use the screw to hold the pem nut in placewhile the epoxy sets up and
don't get any epoxy on the
screw or threads of screw or pem nut

just use a toothpick to build a fillet from outside diameter ring of pem nut

and up against chassis

JB Weld may work or call your local industrial hardwarse stor or Mc Master
Carr on line and they
can advise. (Locktitie TM may also have a solution)

Using a larger diameter Pem nut is asking for same problem later

Surprised ACOM would bother to suggest that as a fix.

As an Acom warranty repair center, doing this "pop-rivet" fix was part of
our training and it works quite well.

The best thing to do is to avoid this problem altogether and the only way
to do that is to not press inward on any chassis screws when loosening or
tightening them. If Acom's construction is weak in any area, it is without
question these "PEM" nuts.

Do not overtighten the chassis screws when you re-install them. This will
help you in *not* needing to press inward when you try to remove the
screws the next time.

I also lost some PEM nuts on my 2000A. I went to a different direction. I ended using small sheet metal screws with success. I marked the holes so I don't force threaded screws in the wrong place.

Also, do not use any sort of power screwdriver in installing or removing the screws. You will over torque the PEM nuts and then you'll have the challenge!

Use a a pozidrive bit #1 size. It will fit better than the standard phillips #1 or #2 bit. Also "very important" use a NEW bit as typically everyone has an old favorite phillips screwdriver and the head will be worn. Remember "our SAE phillips head drivers" are for SAE screws not METRIC screws! That's another reason for buggering up the screws. The metric screws are vary soft!

Also there is no need to heavily torque the screws. Hand tighten until it won't turn ...do not give it that extra 1/4 turn!!!! you'll loosen the PEM nuts!

I found the Metric screws at "small parts" but they are not black.
Amazing how well a little spray paint can fix that!

Dick,

I think we only have the normal sized ones.

I can ask Acom to send us a bunch in our next shipment.

3517. shut down start up procedure

Yahoo group: acom-list (2010 — 2016)
Date: 2010-02-15 03:19:42 UTC
From: kamarty456
Topic: 3517 Message: 3517

I am simply curious as to what everyone does in shutting down the 2000A
when they are done operating ....

For example, I allow time for the tubes to cool down to around
40C or about 104F plus or minus in the standby mode. Then I hit the on/off button on the RCU. After all is quiet I turn off the main switch on the amplifier.

When I fire up the 2000A I allow a few minutes after the initial warm up time to ensure everything is stable. After a few minutes I then get
the amp on line. I am not concerned about the warm up time or additional time I take as I turn the amp on first while I power up the rest of my station.

Marty, my turn off procedure is the same as yours. On startup, the second the 3 minute warmup ends I will start talking, that is if I am ready to talk.

I never turn the main switch on the amp off. I turn the amp off at the remote control when I'm through for the day. I turn it on first when something I want to chase is heard. If the temp was HIGH from a long period of heavy use, I would let the fan cool the tubes first before turning it off.

I asked ACOM about any difference in tube life between leaving it one all the time and turning it on/off like this and they recommended what I'm doing. No advantage in tube life from doing anything else.

Subject: [acom-list] shut down start up procedure

I am simply curious as to what everyone does in shutting down the 2000A
when they are done operating ....

For example, I allow time for the tubes to cool down to around
40C or about 104F plus or minus in the standby mode. Then I hit the on/off button on the RCU. After all is quiet I turn off the main switch on the amplifier.

When I fire up the 2000A I allow a few minutes after the initial warm up time to ensure everything is stable. After a few minutes I then get
the amp on line. I am not concerned about the warm up time or additional time I take as I turn the amp on first while I power up the rest of my station.

3520. Tube replacement Acom 1000 after 5.5 years of usage

Yahoo group: acom-list (2010 — 2016)
Date: 2010-02-15 17:20:36 UTC
From: Kees - pa7two
Topic: 3517 Message: 3520

Exactly 24 hours before the PACC
contest start I had an tube failure in an Acom 1000! It started of in
the morning time with all over sudden an increased amplification by
the tube. When CW was keyed, the frontpanel display showed a 13.5DB
amplification on 7MHz, with only 33 watt input, which resulted in a
1100+ watts out, which does not make much sense. A release of the CW
key and a re-start of a CW transmission resulted in normal amp
behaviour.

Next was a series of CW QSO's where with
some re-tuning the amp and these power spikes were shown again on the
amps frontpanel. Then during a QSO the amplifier displayed ?ARC?, lost output power and the tube
had only about 40% of max power left when the amp was re-rebooted.

I had some pre-heated tubes in stock
(in this case a 1987-11 tube, pre-heated in 2008), so I inserted such a tube in the amp,
left it running idle for 12 hours. Then I adjusted the BIAS based on ptt
only and 2.5 watts input.

After I QSO-ed a bit on half power for
about an hour or so, I decided that this was enough for the burn-in
period.

Next was the PACC TST and so the tube was exposed to medium
power for 18 hours operation in total with around 72-74 degrees Celsius temperature of the chimney.
While comparing the amplification before
and after the contest period, the tube produced on most bands an extra
0.5DB more gain, meaning it was getting used to its new environment,
just as it should.

The original tube was still running
full output power before this ?ARC? event, and never ever had any
problems during the 5,5 years usage!

As you know, when turned off from the RCU, the 2000A displays a message that it's waiting for the tubes to cool off. I've been skeptical that this feature actually works because I've never seen it take more than a few seconds before the 2000A shuts down. Then again, I haven't done a rigorous experiment where I heated up the tubes a lot before shutting down.

It's perfectly OK to transmit right after the warmup period has completed.

One of the things I really like about the 2000A is that it detects when the amp has been on (tubes warm), and shortens the warmup time accordingly. This is great if you accidentally turn of the amp or have to do a shutdown/startup for some reason.

I leave the power switch on all the time and turn on/off from the RCU (amp is remote from the shack, in the basement below.) The exception is during lightning system, when I turn off the 2000A and disconnect it from the AC mains.

Hi Hal,

Yes, I think in the same direction. The moment it happened was just badly choosen, just before the contest pffff, but we made it :-)

I wonder what caused this fault condition...? 5.5 years is not that old for a tube. Average 1.5 hour a day overall usage and some contests is roughly 2000 hours of usage with maybe 50% real usage (RF trans mission) at the very most?

Hi Martin,

Can□t see any reason to turn off the ON button on the amp. The power draw is low. Simply use the RCU for Power ON and OFF.

If you are going to use the amp the same day again, why even bother turning off the RCU?

Hello Dick,

Do you think Dick that leaving on the AC main all the time shortens the GU74B tube(s) especially with voltage going through continuously? From what I remember, the counter does keep going. What do you think for I had this in mind since purchasing the A2000 two years ago.

With an ACOM 1000 or an ACOM 2000A, is the HV really exerted across the tubes when the MAINs switch is on? (I mean the MAINS switch on the back of the ACOM 1000, not the ON/OFF) in the front.

I can't imagine this being so. If it is so, you might as well unplug it. Granted the 1000 and 2000A are different amps, but I thought the ON/OFF on the from was all you needed to do to turn it off during moderate periods of inactivity. Were I going away for several days or more, I'd turn off the MAINS switch and unplug it, but not for an overnight period.

At least on the 2000a the high voltage and filaments are not on until turned on by the RCU. The mains switch on the front panel just provides power to the RCU and a low voltage supply. The tubes are not affected.

OFF means off. I think only the control power to the remote remains on. When you shift from off to on the timer is counting down the time for the heaters in the tubes to warm up before applying the high voltage.

If do don't think the tubes are cooling down when the indicator says they are, watch the temperature indicator at the top of the remote. You can watch the air temperature in the chimney above the tubes as often was you want. If you don't BELIEVE it works, hold key down at 1400 watts for a short time! Then watch it cool back down at key up.

The final tube in a BC-610 used to glow like a light bulb at a kW! Didn't seem to hurt it.

I think tube life is limited by grid shorts or the creep of material in the filament over time. If the Eimac factory was still open in Calif you could look at tubes cut open to examine failure modes. I used to leave my 4CX1000A filaments on constantly in the Collins 30S1 and get about 3500 hours life. (Tubes were cheaper in the 1960s.)

The 2000A will probably outlive us all.

Hi Kees,
I got 6100 hours of power ON time before I got a grid to cathode short with a GU74B in the 2000A. The second tube failed at about 7000 hours. I cut one apart. It looks like the cathode white insulation was not properly installed on the cathode. Or else from operation it "flowed" down the cathode to cause a high resistance "short" between the grid and cathode?
To me 7K hours seems low compared to the 8874's I used to have in a pair of Alphas. And those I pushed a lot harder.

Hi Tony,

Thanks for your reply.

The Svetlana specs as listed here: http://www.df6na.de/df6na/gu74b.htm (Datasheet 1) says a minimum of only 1000 hours of usage for a GU74B... If that is the case, 3000 hours is average lifetime and anything beyond is a bonus?

3533. Serial Numbers not matching

Yahoo group: acom-list (2010 — 2016)
Date: 2010-02-16 14:45:37 UTC
From: Rainer
Topic: 3533 Message: 3533

I receive following message after the preheating is finished:
------Serial Numbers not matching ------
In the description I din`t find any info to this message however, that error approximately 5 sek then it switches in the background, the function of the amplifier is not limited.

The backup battery behind the front panel is ok = 3.3V DC.

3534. RE: [acom-list] Tube replacement Acom 1000 after 5.5 years of usage

Subject: RE: [acom-list] Tube replacement Acom 1000 after 5.5 years of usage

Hi Tony,

Thanks for your reply.

The Svetlana specs as listed here: http://www.df6na.de/df6na/gu74b.htm (Datasheet 1) says a minimum of only 1000 hours of usage for a GU74B... If that is the case, 3000 hours is average lifetime and anything beyond is a bonus?

Vy 73, de Kees.

Subject: RE: [acom-list] Tube replacement Acom 1000 after 5.5 years of usage

Hi Kees,

I got 6100 hours of power ON time before I got a grid to cathode short with

a GU74B in the 2000A. The second tube failed at about 7000 hours. I cut one

apart. It looks like the cathode white insulation was not properly installed

on the cathode. Or else from operation it "flowed" down the cathode to cause

a high resistance "short" between the grid and cathode?

To me 7K hours seems low compared to the 8874's I used to have in a pair of

Alphas. And those I pushed a lot harder.

73,

N2TK, Tony

Hi Hal,

Yes I agree. However, the actual usage of the tube, meaning putting out RF,

must be a substantial lower amount of hours. Still seems pretty early to me?

It was a GU74B, the Russian tube. Acom 1000 amp.

Subject: RE: [acom-list] Tube replacement Acom 1000 after 5.5 years of usage

Well Kees, 5.5 years at 1.5 hours a day is around 3,000 hours. Tom of

Tom's Tubes always said 3000-3500 hours was typical, although most of us

seem to have better luck. Sometimes manufacturing defects can show up

as an early failure. It's also possible but unlikely that the tube was

not new when the amp was new. There have been supply issues off and on

over the years as you know, and a few desperate measures were taken to

keep shipping amps by at least one manufacturer......

Was it a 4CX or a GU74?

Hal

Nothing to worry about !
This means that the RCU (control box) has been replaced
or mixed up with a similar unit somewhere, some time.
The PA and the RCU is produced and numbered as pairs
at the factory. This does not in any way influence operation.
Nothing to worry about !

If you find that message distracting you can eliminate it.
As said earlier it has no effect on the operation of the amplifier!

You need to do a "reset of the memory" The manual discusses this in detail. You will end up losing your user set amp adjustments, the hours run time will reset to zero..essentially you are returning the RCU back to default.

Press and hold the ESC button and turn on the main power switch on the amp. This process should take 5 seconds or so to complete.
page 23 section 5-7 of manual details what will happen.

After you reset the unit the "serial numbers not matching" error message will be gone.

You will then have to have your amplifier relearn your antennas and settings...not a big deal.

3539. RCU running time in hours

Yahoo group: acom-list (2010 — 2016)
Date: 2010-02-19 03:21:52 UTC
From: kamarty456
Topic: 3539 Message: 3539

This question has come up a number of times..
"What does the hour indication tell you?"

I refer you to message #608 dated Oct 4, 2001 from Krassy.

He tells you that the time indicated is telling you how many hours the heater [voltage] is applied to the tubes.
Thus with the amp main switch on and the RCU in "off" the display not lit..the time is not counted.

When you press "ON" on the RCU and power is applied and the amp is in operation or standby the clock is counting. [RCU display lit]

So..I have 3600+ run hours on my 2000A meaning the tubes have their heater voltage applied and running for that total time [not very accurate but close enough]

Hope this helps

Martin KA7GKN

3540. Extending the RCU separation distance?

Yahoo group: acom-list (2010 — 2016)

Hi All,

I really want to put my 2000A about 150 cable feet (~50 meters) away from my operating position.

Has anyone tried this? What sort of contraption might be required to amplify or drive a longer cable?

Thanks in advance,

Mike - W8MM

Topic: 3540 Message: 3541

Mike,

You might be able to do with just a good
"cable" since the baud rate is so low
(1200, I think).

http://tldp.org/HOWTO/Remote-Serial-Console-HOWTO/serial-distance.html

Or an elegant soultion would be:
http://www.minicom.com/kvm_232.htm

Use google and search for RS232 + extender
for more...

I'm still interested in the original question. Does anyone know
if there is a menu display that will give you the tube hours on an
ACOM 1000? I know the 2000A, with many more bells and whistles, will
do it. However, I just have the 1000. :-)

Mel,

Thanks so much for the reply.

As I look at the schematic (suggested here:
http://groups.yahoo.com/group/acom-list/message/2552), I see on page 39 that the RCU connection has some connections that might confuse RS-232 extender gizmos. I don't think the +/- 18v connections on pins 1 & 9 being ground instead would mess up, but pins 2,3 & 5 are completely different from what would be expected.

I think it's down to making up a cable from Belden 9683, or some such, with really low capacitance and trying to pair up the pins in a thoughtful way.

From: Bob Naumann
Topic: 3540 Message: 3548

The only similarity between the Acom 2000A remote control and RS232 is the use of the DB9 connector. It is not RS232.

Acom already offers a 10m extension cable for the Acom 2000. You could conceivably make one longer, or hook multiples of them together to reach the 150'.

That said, 150' is a long way. What's the reason for this distance?

Aside from turning it on and off, you don't need to touch the amp in most circumstances at all. Maybe there is a simpler alternative?

I'd plan on having some 31 ferrites handy,,,,
i made up a nice 15 foot and got rf into something....
it got scary for a bit ,,,, i forgot what happened , but ferrites
calmed it .,..

http://picasaweb.google.com/Bill.SteffeySr/HamRadioNY9H#5309374146062716674

bill /3

i am now using a family friend's broadband,,,,

using $80 wifi "repeater" and some used wifi antennas from ebay...
from my friends house up 150 feet & a mile away (south) to his
silos.....where the repeater is mounted....@ 30'.... my place is 2
miles north from the silos..and up another 250 feet.

AND IT SEEMS TO BE STILL WORKING HOLY COW #@^#@$#@....

3550. High power 12V inverter for Acom mobile?

Yahoo group: acom-list (2010 — 2016)
Date: 2010-02-26 13:26:21 UTC
From: kristinnandersen
Topic: 3550 Message: 3550

Hi:

I am contemplating operating my Acom 1000 from a place where there is no commercial electricity. So, there are at least two options - using a diesel/gas fueled generator, or possibly using an inverter to convert the 12V automobile voltage up to 230V AC.

Now, for the automobile option I would need to consider at least two things:

- Are there inverters available (or schematics for home brewing), capable of transforming the required power?

- An ordinary car battery will not provide the necessary power. But would a bank of parallel batteries do the job, assuming that my duty cycle is low enough to allow the car alternator to keep them charged? Any suggestions on how to wire this up?

Any comments would be appreciated. 73 - Kristinn, TF3KX

Topic: 3550 Message: 3551

A generator is probably the best way to go in this case but even that will need to be a fairly stout generator to provide 10A @ 240v or 20A @ 120v.

The inefficiency of inverting low voltage DC to (relatively) high voltage AC is not good. Regulation would be very poor and you'd end up drawing very high current from the batteries. 10A on 240v equates to ~200A on 12v. There are commercial solutions for this, but they are very, very expensive.

The other option would be to use a smaller DC mobile amplifier (400w or so) intended to be run off of car batteries. Even with this, it will draw something like 50A when you transmit so you will need a couple of HD batteries and a very HD alternator in the vehicle. Some HD pickup trucks have dual batteries and heavy duty alternators that allow you to do this sort of thing more easily.

73,

Bob W5OV

I would go in the generator direction.
There are two types of inverter, pure sine wave and what can only be described as a rough square wave type.
The pure sine wave will work, but (a big one) they are very expensive and possibly not made to cope with around
1.5Kw output, maybe a bit high but on the safe side.
The other type will more than likely give you very poor transmission reports at best, and may damage the amplifier
at worst.
Current out from a battery pack would be in the order of 100 Ampere, which is very high. I doubt you could keep the batteries
charged unless you have a generator.
There are a few places that advertise on Ebay and other places on internet, a company in Germany springs to mind but I cannot
find an address for them
So a good 2 Kw generator would (and is) my choice.
Yes problems carrying fuel and spare oil, but it does work,
I use this arrangement frequently in a motorhome working portable on 50Mhz and
above. Yes the generator weighs nearly 40Kg and is a real pain to load and unload but all I need is gas (50 litres available) to power it
and a small cover to keep the rain off.

A question here about cw/ssb and generators :
I have never tried running QRO CW/SSB from a generator,- but I did ask
a generator salesman about the subject when planning a dx-pedition that
was never realized. He asked me about the ratio between standby/steady
power consumption and peak power consumption,- the rate/time rise
from stby to full power and the cycling time... It was pretty easy to explain that
I would go from a couple of hundred watts to full load in milliseconds and probably
several times per second as we do in CW and SSB. He then told me that I had to
buy (or rent) a generator capable of supplying at least twice the required peak power
and then ballast (load) it with a steady load (like an electric heater etc) equal to half
the peak power required. Definitely NOT an economical solution !! The reason,- he
explained,
was that if not done that way the generator voltage and/or speed control could collapse or
get so confused that you could easily damage connected equipment...
I believed at that time that the man was just trying to make good business...
Later I asked a good friend who used to mix sound/light at big outdoor music events about
this.
He told me that FOR EXACTLY the same reason they would always use a ballast load...which
could be steady lights OR big electric heaters !!! That is: If they ran off generators
Now to my question : has anybody on this group any experience with QRO CW/SSB and marginal
generators like the 2 KW unit mentioned in this thread for powering Acom 1000 plus TX ????
I would be very interested to hear !!! Is this rule about 50% steady load a professional
standard
only,- meaning : As amateurs, for occasional use without strict reliability requirements,
will we
get major problems or not using a 2KW gen powering 1.5 KW in CW/SSB ??

For info, I have a 3kW inverter on my boat which is fed from 4 x 110 ah batteries. The inverter also charges the battery bank however, i specified a 240v, 5kW generator output and it can take 8 to 10 hours of solid charging to get the bank up to full charge. However, i'm sure i could operate at around 400w for a few hours before 240v line shut down - but the complexity and expense is heavy.

The most efficient method of storing small to medium energy requirements is in the form of diesel. Get a generator.

We use an 8kW generator with an Acom 2k. Mostly with ssb but also some cw experience. Never thought about the loading although we often put a 1000w light on to force some voltage drop from no-load 253 volts to 248 volts when drawing 1000w.

Maybe we should always leave the 1k load on..?

As many others I would recommend you to go for a generator. Preferably one with a Diesel engine, because of the higher turning mass, that is an advantage with a variable load (CW/SSB). Diesels are also by far more economic to run.

I would recommend one of the chinese Changfa generators (YANMAR clones). They are cheap, and have good fuel ecomomy. Downside is that they are noisy. They are sold under many names, but all looks something like this:

http://www.pump.co.uk/images/library/stock/feature/CED4000_XE.jpg

I bought a Changfa with a CF178F engine/generator a couple of years ago for 330 euros, and I have run the ACOM1000 on it with no problems.

Hi to all
CED 4000 seems to be 2.6kVA with pik 3.okVA I really wonder how it can run ACOM + transciver especially in CW mode when current jumps so qickly. From experience we know that one can use only 75% of listed power it means in this case 1.9kVA but with steady load !! and engine is working very hard.
My experience with Honda 2.6 kVA is terrible - Icom 706 in 100W CW cannot work - every dip of voltage is switching off transceiver. I have to reduce power to 60!!!W . It will run small refrigerator some lamps and TV set that's all there is no way to connect Air Conditioner!! Every change in load makes big fluctuation of revolutions, V, frequency (should be 50 Hz but it depends on revolutions) and annoying change of sound from generator.
I fully agree with salesman who described generator and half load connected in order to maintain V somehow stabil, it is exactly how generators works and power 2.6 kW or even 4kW means nothing in this case.
In my opinion mobile PA 400-500W is more then enough even with simply wire antennas in the area without electricity - it is much easier to charge batteries. My emergency set up is : Icom connected to batteries which are connected to the charger -so bateries are charged during every break in transmitting..
So before you buy generator think twice (ACOM is quite expensive toy) and the best is rent it for two three days and make a tests...
Kristinn whish you luck

Subject: [SPAM] Re: [acom-list] High power 12V inverter for Acom mobile?

HI Peter
Salesman is fully right - it works exactly as he said. And still is a big risk due to instability while load is changing rapidly...
You have to believe me I am 9 years in Sierra Leone and generators always were making us crazy...
If you can - stay away from them for radio purposes of course. If you have to - use them to charge batteries and connect Radio to the batteries.
Zbig 9L1BTB
****

Hi Zbig !
Thank you for sharing your experience ! Yes--it also seemed very logical
to me when I got time to think it over !
I think maybe the problem could be less by adding a very heavy turnwheel
to the generator driveshaft. That would give it more inertia as a result of a bigger
rotating mass,- and should result in more ability to handle fast load variations....
but it would be a VERY heavy generator :-)
Another method might be to use a generator to charge batteries as you say,- but
by using a constant current charging circuit...this way the generator would not see
any load variations at all...BUT a constant current charger needs to be switched off when batteries
are full and on when needed...this brings up the need for a slow turn on /turn off of the charger
(to avoid generator load peaks) while providing constant current under charge..an AC generator would
probably be most practical
as AC is more easily controlled (voltage etc) : Using AC one could control the generator field
more easily for this purpose. The current control and on/off (ramping up/down) could then easily
be done with a low power circuit...eliminating the need for a large charger.
I am not into automobile electrics...but it would not surprise me much if suitable circuits could be
bought at automobile supply shops !! One could then use an inverter for generating necessary 230V
AC ,- for example. These are available commercially with very high power capability...but are expensive !
A system like this would completely isolate the load variations from the generator...and it would

provide UPS (uniterruptible power supply) so that one could stop the generator for refueling etc...
One would need a fairly large battery bank !! This system is NOT practical for portable use,- but would be
ideal for stationary use in remote locations,- providing very stable and secure power and probably
also result in much less generator wear. I have a feeling I just re-invented the wheel ? :-)
You can buy these systems commercially....that is: If you are very rich :-)
by using large batteries you could of course get away without the current control/ramping circuit...
but then you would still see large rapid variations in generator load, despite the batteries...at least running QRO.
The above described system would also call for a much smaller generator as it only needs to supply
the average power...and you can average that over as long a time-period that load and battery capacity
allows for.
I think I have just gotten myself a summer project ! Where is that lawn mower ? And I do have an AC generator
in my car ?? :-)
Peter

Subject: Re: [acom-list] High power 12V inverter for Acom mobile?

A question here about cw/ssb and generators :
I have never tried running QRO CW/SSB from a generator,- but I did ask
a generator salesman about the subject when planning a dx-pedition that
was never realized. He asked me about the ratio between standby/steady
power consumption and peak power consumption, - the rate/time rise
from stby to full power and the cycling time... It was pretty easy to explain that
I would go from a couple of hundred watts to full load in milliseconds and probably
several times per second as we do in CW and SSB. He then told me that I had to
buy (or rent) a generator capable of supplying at least twice the required peak power
and then ballast (load) it with a steady load (like an electric heater etc) equal to half the peak power required. Definitely NOT an economical solution !! The reason,- he explained,
was that if not done that way the generator voltage and/or speed control could collapse or get so confused that you could easily damage connected equipment...
I believed at that time that the man was just trying to make good business...
Later I asked a good friend who used to mix sound/light at big outdoor music events about this.
He told me that FOR EXACTLY the same reason they would always use a ballast load...which could be steady lights OR big electric heaters !!! That is: If they ran off generators
Now to my question : has anybody on this group any experience with QRO CW/SSB and marginal generators like the 2 KW unit mentioned in this thread for powering Acom 1000 plus TX ????
I would be very interested to hear !!! Is this rule about 50% steady load a professional

standard
only,- meaning : As amateurs, for occasional use without strict reliability requirements, will we
get major problems or not using a 2KW gen powering 1.5 KW in CW/SSB ??
"Peter"

Subject: Re: [acom-list] High power 12V inverter for Acom mobile?

I would go in the generator direction.
There are two types of inverter, pure sine wave and what can only be described as a rough square wave type.
The pure sine wave will work, but (a big one) they are very expensive and possibly not made to cope with around
1.5Kw output, maybe a bit high but on the safe side.
The other type will more than likely give you very poor transmission reports at best, and may damage the amplifier
at worst.
Current out from a battery pack would be in the order of 100 Ampere, which is very high. I doubt you could keep the batteries
charged unless you have a generator.
There are a few places that advertise on Ebay and other places on internet, a company in Germany springs to mind but I cannot
find an address for them
So a good 2 Kw generator would (and is) my choice.
Yes problems carrying fuel and spare oil, but it does work,
I use this arrangement frequently in a motorhome working portable on 50Mhz and
above. Yes the generator weighs nearly 40Kg and is a real pain to load and unload but all I need is gas (50 litres available) to power it
and a small cover to keep the rain off.

Subject: [acom-list] High power 12V inverter for Acom mobile?

Hi:

I am contemplating operating my Acom 1000 from a place where there is no commercial electricity. So, there are at least two options - using a diesel/gas fueled generator, or possibly using an inverter to convert the 12V automobile voltage up to 230V AC.

Now, for the automobile option I would need to consider at least two things:

- Are there inverters available (or schematics for home brewing), capable of transforming the required power?

- An ordinary car battery will not provide the necessary power. But would a bank of parallel batteries do the job, assuming that my duty cycle is low enough to allow the car alternator to keep them charged? Any suggestions on how to wire this up?

Any comments would be appreciated. 73 - Kristinn, TF3KX

3561. RCU temperature display question

Yahoo group: acom-list (2010 — 2016)
Date: 2010-03-03 02:41:23 UTC
From: kamarty456
Topic: 3561 Message: 3561

How accurate are the displayed temperatures of the exhaust air?

For example:

I get a displayed reading for both tubes at say 53c [127f]
I have an external temperature probe directly above the exhaust
expanded metal openings and I get a variance. I see about 104f [40c]

I know the sensors are fairly close to the top of the chimneys
I do not have any variation when I move the external probe between the front or rear exhausts.

The external temperature monitor is accurate.

I am not overly concerned as the amp is performing perfectly. But recently I did have to calibrate the line voltage displayed on the RCU.
I discussed this in another posting.

This may be nit picking but anyone know what the tolerances are for any readings on the RCU?

It's time for all of you to visit your Acom amplifier air filters
and clean them...dirty filters reduce air flow and then you can have
problems!

Take the time to clean them and dust off the amplifier!

I live in Arizona where it's dusty! I clean my air filters
every 3 months! By doing this I have experienced very little accumulation of the dreaded
dust bunnies and other dust inside
the amplifier! I do blow out the inside of the amplifier every
two years, whether it needs it or not.

I bring this up to the group as it's a chore we often forget to
address and preventive maintenance is a lot cheaper than those
unplanned failures and repairs!

3571. Help!! G2 Low voltage - burnt smell - How to get to Low Voltage Board

Yahoo group: acom-list (2010 — 2016)
Date: 2010-03-09 01:46:05 UTC
From: nu6x
Topic: 3571 Message: 3571

Yesterday, twice my Acom 2000A faulted with a G2 Low voltage - 196V. The amp had been in OPR but had not TX for over an hour. I smelled a burnt resisitor smell. I also noticed hot air from the tubes even though I had not transmitted for over an hour. After taking it apart I carefully search everything I can see and can NOT find which part went up in smoke.

After putting it back together, the amp would come back up in the operation position but sometimes would put out hot air (50 C with no drive). I started monitoring the Grid Bias Voltage and notice it was jumping around from 75v - 125V. Again no drive. Now it as stablized (lst 24 hours) at -125 in OPR, and -80 in TX with no drive. It now seems to be working OK but still have left over burnt smell. I don't know what caused the original G2 Low Volatage faults but screen voltage is now at 340V. I'm wondering if the bias failed, causing it to heat up and then somehow this caused the Screen voltage to drop.

I suspect LOW Voltage Supply board. Is there any trick to removing it???
Any ideas what part may have burnt? Any suggestions on what caused the original fault?

The amp is 3 years old but with only 265 total hours.
Thanks in advance!!! Mark NU6X Sedona, AZ

Did you open the cover on bottom of the Acom and check inside there,

be sure to also look at filament connector toward back of amp.
I know the earlier ones use to burn but not sure if newer amps
experience that problem .....

Mark,

Sorry to hear about your problem. I had to work on the Low Voltage board once. It's doable but not easy, because you have to remove the High Voltage boards to get to it. I posted photos at:
http://groups.yahoo.com/group/acom-list/photos/album/316703771/pic/list?mode=tn&order=ordinal&start=1&dir=asc

3574. High power 12V inverter for Acom mobile

Yahoo group: acom-list (2010 — 2016)

Reading some messages it seems generators are not reliable
even with 100 watt only.
On Dx-peditions generators are the only way to get power
Does anyone know if there is a "top-level generator" ?
Thanks

The HONDA 5kW (or similar) all worked fine, reliable, low noise on Swains Island. All three DXpeditions! KH8SI twice and N8S. I would stick with those.

Agreed !

But Honda has several different models for each power range !
Some of them are simple,-relatively low cost units = not suitable.
The only recommended Honda series for these applications is the
Honda EU series with inverter and processor control. They are
not cheap.. but they can do it ! And they are quiet too !! Just make
sure that your power demand does not exceed 75 % of the generators
max capacity. It is the inverter that does the trick. I have followed a
discussion on a group dealing with high power audio systems and they
came to the very same conclusion.

I don't think you can give generators such a broad brush write-off.
There are generators out there that will deliver instant high-demand.
I know, i have one - although it's got an 8kw constant load capacity.
Every high powered field-day station in the world uses diesel
generation. It's well proven.

Inverters running off battery banks topped off with a constant
generator will be much, much more expensive and heavy.

In terms of storing power reliably, and letting it go in a controlled
fashion, deisel is still the winner.

I don't know the specific answer to your question but i've used
several generators with different clubs over the years and never
suffered a problem.

One more thought: the smart money would be on using a torque-adjusting screwdriver for these screws. Can you get a factory recommendation on what torque setting we should use?

From: Bob Naumann
Topic: 3499 Message: 3580

The torque is not the issue with these screws.

You can tighten them plenty tight. The problem comes when you bear down and press inward to loosen the screw. This can cause the pressed-in captive nut to come loose from the chassis and drop in when the screw is removed. So, focus on only apply a twisting motion and not pressing inward on the screws.

Thankfully, one does not need to open these amplifiers up on a regular basis so this is not as much of a problem as it might be otherwise.

73,

Bob W5OV

Topic: 3499 Message: 3581

why any manufacturer would use pem nuts on high value electronic equipment is baffling. it is a money back guarantee that eventually one or more will separate from the frame and drop in and vanish in your $7000 amplifier. you now have the task of hoping that it will "shake out of the amp", or unfortunately, you may have to dissemble it to find the pem and prevent that horrible loud "KAPOW" when it dead short welds whatever it is touching.

The torque is not the issue with these screws.

You can tighten them plenty tight. The problem comes when you bear down and

press inward to loosen the screw. This can cause the pressed-in captive nut

to come loose from the chassis and drop in when the screw is removed. So,

focus on only apply a twisting motion and not pressing inward on the screws.

Thankfully, one does not need to open these amplifiers up on a regular basis

so this is not as much of a problem as it might be otherwise.

Subject: [acom-list] Re: Acom 2000A Screws

One more thought: the smart money would be on using a torque-adjusting

screwdriver for these screws. Can you get a factory recommendation on what

torque setting we should use?

Thanks

3582. Error Decoding and dead panel light

Yahoo group: acom-list (2010 — 2016)
Date: 2010-03-23 22:56:09 UTC
From: Jack K5FSE
Topic: 3582 Message: 3582

I tried to see if there were any msg relating to an error code I just got. Low and behold, I found one...mine?..sent a year ago, but was never answered. All has been fine since then, but now I got it again. PLUS the light behind the green panel just went out? Please read a copy of my original email, shown below, and any suggestions would be appreciated. The error seems intermittent. Now all is fine, with normal power out...but still no light behind the panel.

Good afternoon all. I have a 2 yr old 1000. I have a small piece of plastic sheeting attached over the fan to keep dust out when the amp if off. It's taped on one side and flies open the minute the fan turns on. Yesterday, just a few seconds after turning the amp on, I noticed the sheeting was not moving.

There was some air, but very little. Then I noticed the error code
1APN25 000000 000600. From the manual, it seems this is happening in the Power-On cycle (yes) and that it has something to do with screen grid current. Am I interrepting this correctly, and what does it mean?

I see reference to an Excel sheet for decoding help, but didn't see it on the Acom site, but apparently it's been send to members of the list previously from what I read. I didn't see it posted in the Files sections. Can someone sent it to me?

Thanks for taking to time to read this.

From: DAVID
Topic: 3583 Message: 3583

Switched on my Acom 1000 this morning as normal but afetr about 20 seconds of warm up it cut out and displayed the message 'Auto protection: SB2B'. I tried restarting many times but always ends up with this message, sometimes after a few seconds and sometimes after 30 seconds or so.According to the manual an SB2 fault is a stand by fault after warm up but this is occurring during warm up. Can't find the Excel document detailing the fault codes anywhere on the net either. Anyone else seen this problem,whats it's cause and whats the fix please?

This error shows that the output relay is closed.

Is PTT activated from your radio? Pull the PTT cable from the amp and try turning it on again.

Hi Marcelo,

The name of that is "Remote Power On" and is build by Acom.
Acom sells that accessory for ? 72 Euro.

Anyone interested can contact Acom.

Hi all,

I buy an amplificator ACOM1000 last week, I wait it, how plug it to my Kenwood TS450 SAT ??
I see it is a RCA pin, I lost the manual of my Kenwood, I don't know what is pin number??

If it possible to give me info to plug ACOM between TS450 SAT.

Tnx in advance

Regards

3592. Re: Remote-on adapter

Yahoo group: acom-list (2010 — 2016)
Date: 2010-04-30 01:57:00 UTC
From: ki4ge
Topic: 3585 Message: 3592

Is anyone using the ACOM "Remote On" adapter with TRX-Manager?

I have two of the adapters and have not been able to get either one of them to work properly after working with them for many months.

I have been using TRX-Manager for sevaral years to successfully operate a remote station over the internet and have found it to be a very robust and capable progam that does almost everything I need it to do from anywhere in the world as long as I have a reliable, high speed internet connection (thanks to the hard work and insight of Laurent in developing and supporting the program).

I have two of the "remote On adapters" but have been unsuccesful in getting either of them to work properly.

The internet operation works great without the adapter connected. However, when I install the adapter(either one) the ACOM 2000 does not work properly.

When the adapter is installed, TRX-ACOM does not properly communicate with the ACOM 2000. The tracking function at the top on the TRX ACOM display display shows the proper frequency, which agrees with the frequency displayed on the ICOM 756 Pro III.

The middle display shows that the ACOM 2000 is "ON" but the status of the amplifier cycles between "amp ready" to "switching" with no results. Plus,if I try to shut the amp dowm by clicking on the "shutdown button" or switching from "SBY" to "OPR" nothing happens, even though the software says it is doing what I ask it to do.

Plus, I cannot restart the amp by clicking on the "on" Button as well. I have tried several "null modem" cables but the results are the same.

Since I have two differnt ACOM built "remote On" adapters, it is hard to believe that both are bad, since both were built by ACOM. After many experiments, the only conclusion I am left with is that there is a software conflict somewhere either in my computer or within TRX-Manager itself. It works the same way, either with or without a "SEALINK Serial Server" online.

I am sure that Laurent and Stan at ACOM have tested this capability successfuly before the adapter was released and Laurent incorporated it into TRX-Manager.

I have been frustrated after trying everything I can think of and have even had my son (who is a computer network engineer) help me in trying to resolve this issue. The "Remote On - Remote Off" feature is the only thing that I am missing in having a superb internet controlled means of controlling my system.

To this point, I have been surviving by having my brother (who lives nearby) restart the amp when I need that done, which works but is far from optimum.

At this point, I strongly suspect that I have a software conflict that I have not yet identified.

Any suggestions are appreciated.

Thanks for the help.

From: tim_white150
Topic: 3593 Message: 3593

Hello All,

I have just purchased a pre-owned 2000A from someone here in Australia. I installed the transformer, connected everything up and was greeted by the RCU continuously sounding the alarm, and no display - just a row of blocks along the top. The RCU is also unresponsive to any key press. I guess I'm not off to a great start here.

After reseating the EPROM in the RCU, measuring all fuses and giving everything a visual check the problem persists. I've just sent the RCU to the local distributor here in the hope it is at fault. It would be nice to not have to ship the main unit around if it can be helped.

I'm new to the group, so hello to all and wish me luck.

3594. Acom 1000 Accessory Fan

Yahoo group: acom-list (2010 — 2016)
Date: 2010-05-19 15:13:28 UTC
From: Mike Harris
Topic: 3594 Message: 3594

Good day,

I have been using my amp on RTTY for a while, usually about 500W O/P. Running a pile-up the blower does occasionally speed up. I'm thinking about installing the accessory fan. My thoughts are that the air filter will no longer be useable because it will restrict air-flow to the fan blades and stall them. Only a wire finger guard will do.

Anyone gone down this route?

Regards,

Mike VP8NO

3596. BIAS TOO LOW AT POWER ON

Yahoo group: acom-list (2010 — 2016)
Date: 2010-05-20 15:51:14 UTC
From: ea4kd
Topic: 3596 Message: 3596

Two weeks ago began the problem of "BIAS TOO LOW AT POWER ON: -000V" in my ACOM 2000.

After some email with Stan (ACOM) and checked voltages on interface PCB, he says that perhaps either tube makes an internal short circuit.

After several tests I observed the following:

Sometimes; just after the warm-up gives the failure: "BIAS TOO LOW AT POWER ON: -000V"

sometimes; one or two minutes after warm-up ended, gives the failure: "BIAS TOO LOW: -049V"

rest of times works perfectly during hours until turn off the amplifier; even with 2 kW.

I have verified R5 and C2 and seems correct. Also, have the opportunity to get a tube (only one) from a friend, to be able to verify if some of my tubes are incorrect. The question it´s if a have a bad tube how can to get with 2 kW. output. during hours.

Can I verify anymore?

Thanks in advance
Pedro, EA4KD

Not sure how easy is for you to order parts from Mouser.com but here is what i've done:

After removing the original metal mesh filter, I installed "Wire Fan Guard" (Mouser p/n 670-G9216) on the INSIDE of the chassis and the fan on the outisde, securing both with srcews. This could be a difficult task if you don't plan to remove the power transformer (I managed to do it withot taking the transformer out but installing the "inside" screws were a real pain).
The reason for the wire guard is mainly to provide some limited RF shielding without obstructing the fan's exhaust airflow.
On the outside of the fan (fan's intake) I installed the 30 PPI snap-on filter assembly kit (Mouser Part #: GRM92-30).
The main point is to allow good airflow intake - the metal mesh filter is OK for the built-in tube blower (as the whole amplifier cavity acts as a buffer/damper and provides some reserve) but with the increased airflow (especially if you are using high-volume external fan) could be limitting to the capacity of the extra fan.
In addition the snap-on filter kit reduces a bit the noise from the external fan and it is very easy to clean/replace.
btw. the "factory" installations i've seen of the external fan is with a wire finger guard on the outside - no metal mesh filters.
If its too much trouble ordering these part's, i'd go with the solution from the previous post and re-use the mesh filter. Because of the increased airflow, you have to remember to clean the filter more often than the standard "no extra fan" version.

Hope this helps

The second fan fitted to an Acom 1000 is a standard 24 volt 'muffin fan. these can be bought from any good
electronic or component shop. Just measure the distance between the filter cover holes (80MM).
From a UK stockist £15.00.
Somewhere I also remember seeing a 'how to fit a second fan' file on internet, which explained it very easily.
I am sure someone can point others in the right direction.
I fitted one when the amp was just out of guarantee, only had it come on once in two years. Not sure if
it was worth fitted, but at least it is there if it is ever needed. Only run the amp on 50 and 70MHz, yes have
done the 70MHz mod which is very easy to do.

3601. Line voltage

Yahoo group: acom-list (2010 — 2016)
Date: 2010-06-10 20:35:48 UTC
From: kamarty456
Topic: 3601 Message: 3601

With summer here and the demand for electricity is high I notice at various times of the the day the line voltage can fluctuate. I'm in Glendale Arizona and I'm on SRP electric ...we have two supplier APS and SRP. SRP seems to be the most stable.

Let's visit this.....

Typically the power company claims 120VAC +/- 5%
-or- 116-126VAC I typically see 121-123VAC

240VAC +/-5% -or- 228-252VAC I typically see 242-247VAC

My ACOM 2000A obviously is wired for 240VAC.
I usually see 242-247VAC on the RCU display and after calibrating the voltmeter it follows fairly well my external AC voltmeter always in line.

Now and then the yellow heater LED will blink. The speed of the blinking provides two parameter warnings. One is the heater voltage is too high and the other indicating the line voltage is too high.

Any of you have challenges with your 240VAC line voltage being
"too high"????
If so, what do you do to regulate the voltage?

I have my 2000A for over 9 years and have never experienced any failure due to excessive line voltage. I'm asking to see of others are concerned or if I'm just over reacting?

3602. Acom 1000 going off tune

Yahoo group: acom-list (2010 — 2016)
Date: 2010-06-10 21:41:25 UTC
From: Martin Andrew
Topic: 3602 Message: 3602

Not really a major problem but it could get worse.
I have an Acom 1000, about seven years old, original tube,
second fan fitted but not really required.
I only use the amplifier on 50MHz and normally around 400 Watt.
The amplifier has a modification for 70MHz.
Use both SSB and WSJT.
Antenna is close to tune at 1.4:1 at worst.

Over the last few months after switch on and initial tune up I noticed
the amplifier would go off tune with the indicator on the front panel going
to the right. Re-tune, all ok then after a few minutes it goes off again. Same
again, re-tune all ok then off it goes again.
At first I suspected I had an antenna or coax problem, but get the same symptoms
into a good Bird 8201 dummy load capable of 500 Watt continuous.
If I reduce power to around 200 Watt all is stable, but what is the point of having a
QRO amplifier if I can only run stable at QRP powers.
Had the amplifier in bits and checked all accessible plugs and sockets, did not remove
the tube.
I cannot see anything even vaguely wrong, but the problem persists.

I am running the original tube, gain is still good with indications of about 13dB gain
though
I do have spares available.

Anyone got any ideas what to look for, or do I change the tube and see what happens then.

MARTIN,

MY LINE VOLTAGE WAS 259.6 VAC, I CONTACTED THE POWER COMPANYAND THEY ARE LOOKING INTO IT. THEY NOW KNOW THEY HAVE A PROBLEM. UNTIL THEY FIX THEIR PROBLEM I BOUGHT A 220 VARIAC, I CLEANED THE BUSS BAR CONTACTS ON THE CIRCUIT BOARD ON THE 240 VAC SETTING AND IT☐S NICE AND STABLE NOW. NO MORE YELLOW BLINKING. THE VOLTAGE AROUND HERE IS NORMALLY AROUND 242 TO 250VAC WHICH IS NORMALLY FINE FOR THE NORTHEAST GRID HERE IN SNJ. THIS IS JUST ONE SOLUTION.

YOU CAN ALSO GET A ☐BUCK/BOOST TRANSFORMER☐ IT WILL HAVE TO HAVE A 240 VOLT PRIMARY, RATED AT 20 AMPS AND ½ KVA WITH TAPS FOR 12 ☐ 24 & 36 VOLTS. WHEN YOU HOOK IT UP, IF THE VOLTAGE IS TOO HIGH YOU JUST SELECT THE TAP (12, 24 OR 36 VOLTS) TO LOWER THE VOLTAGE TO A WORKABLE VOLTAGE RANGE. SO, IF YOUR VOLTAGE SAY IS 264 VAC COMING IN, YOU SELECT THE 24 VOLT TAP AND THAT LOWERS IT TO 240 VAC. IF YOUR INCOMING VOLTAGE IS 252 VAC YOU WOULD USE THE 12 VAC TAP TO LOWER IT TO 240 VAC. I THINK YOU CAN GET THE PICTURE NOW. IT☐S A GOOD WAY TO GO ☐ BUT ONE OF MY BUDDIES WAS OUT IN DAYTON THIS YEAR AND PICKED UP THE 220 VAC VARIAC FOR ME, SO I WENT THE EASY ROUTE, BUT; I WOULD PREFER TO DO IT WITH THE BUCK/BOOST TRANSFORMER, (AND I WILL SOON) THIS WAY I WOULDN☐T HAVE TO WORRY ABOUT THE BRUSH IN THE VARIAC WHICH CAN COLLECT A LITTLE RUST OVER THE YEARS DEPENDING WHERE YOUR HAM SHACK IS (YOU-KNOW: LIKE THE BASEMENT) UNLESS YOU HAVE A DEHUMIDIFIER IN YOUR SHACK. (WHICH I DO). SO AGAIN, I HOPE THIS HELPS SORRY FOR BEING LONG WINDED

The question is whether this is an indicator problem or is the amplifier really de-tuning.

If the output changes with the tuning indication, then it is probably not an indicator problem. Then it could be the loaded plate DC voltage varying (because the 240V AC varies). If this is not the case, then I would indeed try a new tube.

Could it be a ceramic capacitor changing value slightly when it gets hot? That would be most noticeable on 50/70MHz. How is it on the lower bands?

Good luck.

If it will let you, step though the measurements and see what it thinks the HT voltage is. Below 1800V or above 3300V it will trip. If it's low, then suspect that the PSU has failed. Above 3300V, it's likely to be a control board measuring fault, or your AC supply voltage is much too high. Check the temperature reading and see if it's about what you'd expect, because the control board uses a common reference to meter HT, RF and temperature.

Good luck.

I do not use the amplifier on HF, not interested in DC, only bands above 50MHz.
I have done a few more checks and am pretty certain the tube is near end of life
so will change it for one of my spares soon. Screen current is about 2-4 Milliampere
at outputs above 400 watt and causes alarms above 700 Watt.
Problem is more annoying when I do 50MHz EME as power is all over the place
and causes real problems to the other station.
Tube has done 4000 hours so cannot complain to much !.

Could it be a ceramic capacitor changing value slightly when it gets hot? That would be
most noticeable on 50/70MHz. How is it on the lower bands?

Good luck.

Uffe,
Thanks for the reply.
I still have the problem but it only seems to get bad if I run more than 400 Watt (real not on front panel).
I have a separate 40 Ampere feed just for the shack, but I know that voltage feed from the grid does move
by up to 5 Volts. This problem showed up more on my 8877 144MHz amplifier, now solved with a stabilizer
on the input.
I am more suspicious that the tube is getting near the end of life, measuring output with a Bird meter while watching
the front panel meter shows that when the amp goes off tune the output also drops.
Re-tuning peaks output but it is
always lower than the first reading. Let the amplifier idle for a few minutes and the original output is available for
less time before going off tune. Gain also shows a drop on the front panel metering, from 14dB to around 10/11 dB.
I think I will have to bite the bullet and change the tube, not major job to do fortunately !.

The question is whether this is an indicator problem or is the amplifier really de-tuning.

If the output changes with the tuning indication, then it is probably not an indicator problem. Then it could be the loaded plate DC voltage varying (because the 240V AC varies). If this is not the case, then I would indeed try a new tube.

From: sm4oti
Topic: 3561 Message: 3613

Not too accurate. I've made measurements with external high precison meter and depending on exactly (same spot over both chimnies) where you measuring over the chimney you get temp difs of several degrees (0-10 degrees Celsius). Guess the airflown through the chimnies are not exact the same on every spot on the two chimnies, so very difficult to get a very accurate idea of how close the tubes actually are working as a matched pair.

You get a hint, though, monitoring the RCU's temp-figures. If they are way too far the tubes are not matched at all.

By looking on the RCU and at the same time a couple of your fingers back and forth above the chimnies, you get quite a good idea if the tubes are producing about the same amount of heat, and then should be ok as a pair.

Thank you Stefan, I am using a Taylor 9940 digital thermometer set
to read Fahrenheit. I am comfortable with the +/- 24 degree F variance between the external Taylor and RCU Centigrade reading.

I also varied placement of the external sensing probe. I placed the probe over the front tube, rear tube and in between. I also varied placement from direct center of the chimney to the edges and realized minimal difference as long as the probe was in the exhaust air flow.

Typically I shut the amp down after it cools to 40-50 C and I have never had any over temperature challenges.

3615. ACOM 1000 will not transmit

Yahoo group: acom-list (2010 — 2016)
Date: 2010-07-06 01:12:51 UTC
From: aa4v@bellsouth.net
Topic: 3615 Message: 3615

I have owned an ACOM 1000 amp for over 5 years (S/N 020133). I normally use it on 6M but this amp has traveled all over the world with me and I have NEVER had even a minor problem with it on any band or mode. The original 4CX800 is still in use.

This evening I switched on in the normal fashion, waited for 150 seconds and the amplifier indicated 'ready'. I keyed my Elecraft K3 and it put out 55 watts (as set) with an SWR of 1.4:1 into my SteppIR 3 el yagi. When I pushed the 'oper' button to 'green' The amplifier did not show any output and the SWR on the K3 went to 15:1. I unswitched the 'oper' button and again keyed the K3 and it showed 55 watts and 1.4:1 SWR. I recycled the power switch on the 1000 and the same thing occurred...no output. I then switched off and unplugged the amp from the main (240 volts) and waited for 5 minutes.

I reinserted the plug, went through the waiting period, switched the 'oper' to green and still no output. When keying the 1000, the plate voltage on the meter went from 2865 v to 2780 v. Still no output.

Any ideas?

Hi Steve,

Sounds like an input relay fault. I say that because it would explain the high input VSWR on Tx and it would not cause any fault indications on the amp controller since there is no RF for it to monitor.

From: ea3in
Topic: 3617 Message: 3617

Hello

I have my ACOM2000A since 2004

Today the RCU doesn't power on. If you try a few times sometimes you can see a "2" character and hear a beep, but not always.

I have replaced the RCU with one from a friend of mine and the AMP is ok.

So it seems that there is something wrong with my RCU.

A battery problem?

Any idea?

Thanks in advance

Open up your RCU and check all of the connectors and check the IC in a socket. Sometimes these connections get corroded and you need to make them again.

If this does not make it work properly you may have to send the RCU to your dealer in your country.

3619. Re: Remote-on adapter

Yahoo group: acom-list (2010 — 2016)
Date: 2010-07-12 18:41:46 UTC
From: ki4ge
Topic: 3585 Message: 3619

I finally succeeded in getting the ACOM Remote On adapter working with TRX Manager. All features are now fully operative.

I discovered that it is critically important to place a jumper between pins 2 and 3 on the antenna switch connector of the adapter if the ACOM antenna switch is not used. This jumper is necessary to complete the connection, within the adapter, between the ACOM and the computer.

The jumper is not needed if the ACOM Antenna Switch is connected to the adapter thru the Antenna Switch's "AMP" connector and the switch is set to AMP.

I have also discovered that I need to rapidly click several times on the TRX-ACOM "ON" button to switch the amp on. A single click is not enough to turn the amp on. Rapidly clicking 3 times always turns the amp on.

Thanks again to Laurent for developing this fine interface with the ACOM 2000 and TRX-Manager.

3620. 2000A HV VOLTAGE TOO LOW AT POWER ON:0.00kV

Yahoo group: acom-list (2010 — 2016)
Date: 2010-07-12 22:38:51 UTC
From: Sam Leslie - W4PK
Topic: 3620 Message: 3620

Hello all:

I have a very old 2000A (SN137) which is giving the above error message. I have gone through it to make sure the HV transformer is good, the connections good, and the HV rectifier board appears to be good (as far as I can tell with a VOM). The HV on this amplifier has always read about 30% low, so I suspect that one of the three 1M resistors (R10, 11, & 12) on the HV filter board has opened up. Otherwise there are no burn marks anywhere nor do I smell anything that could indicate a burned component or connector.

But this is only a suspicion and due to the difficulty of getting at the HV filter board I thought I would ask first to see if any of you have had a similar problem? Is there anything else that you may have encountered that could cause this error message?

Hi Terry,

You probably have a fried Molex connector in the filament power supply chain. There are two with notorious reputations. One is on the lowest power supply board next to the big XFMR and another under the tube deck. Check them. They're clearly visible. They'll be discolored (brownish).

I fixed both of mine by cutting off the connector and soldering direct. The one under the tube deck is accessible via the little plate on the bottom of the amp. It's a pain to resolder, but obviously possible with some care.

There are a bunch of suggestions with far more detail than I can offer here. Search the acom-list archive.

Thanks Glenn, looks like you were spot on. I have uploaded a few photos into the Group Acom2000A Album of the cooked Molex on the bottom board adjacent to the transformer. I've never replaced or wired a Molex connector. I could solder direct to the pins as you suggest but would appreciate any further comments before I commit and start cutting wires.

Cheers,

Terry

I went straight for the solder on to the pins. The Amp is back up and running! Will soak test overnight and inspect the plumbing in the morning. Phew.

Cheers,

Terry

Good choice Terry. Returning one of my two 2000As for this problem some years ago, the factory service consisted of replacing the Molex on the P/S board with a better one, and jumpering straight across the one down by the tube sockets. The comment from ACOM at the time was replacing the connector near the tubes "was like open heart surgery," and they just didn't think it was worth taking the amp completely apart to add a connector where none was really needed in the first place.

As an EE, and having crawled through every wire of the amp and the schematic - I agree. The Molex down by the sockets is best removed and thrown in a trashcan. These are great amps, but all sophisticated products have their little bugs. Newer serial numbers are reported to have the filament connector issues fixed. If anyone owns an old 2000A and has not had low voltage filament faults so far - you probably will sooner or later. Just jump the otherwise useless connector at the sockets and get on with enjoying your amp.

From: David J. Strout
Topic: 3636 Message: 3636

Has anyone else had the problem where the 2000A stays
stuck in "Arc Fault"? Warms up OK, at first key reads
"Arc Fault" and even resetting the RCU doesn't
clear it. Problems exists on any antenna, all of which
are under 1.3:1, all coax cables and connectors
checked out. Same result into dummy load.
Thanks, W2YC

Just a guess, but I wonder if there is a common piece of coax,
barrel connector etc. that is shorting before your antenna switch? I
have seen this with an ACOM-1000. All antennas seems fine with the
metre/analyzer, but when you hit them with RF, they arc/short. If
you can, take one known good antenna and connect it directly to the
amp, bypassing all switches, etc. That will 100% eliminate the
antenna system(s) and narrow it down to the amp.

The only other time I saw this as a "false alarm" was when RF
got into the MPU of my ACOM-1000 on 6M, and that was fixed with
chokes on the relay and mains cables.

I'm looking for a simple fix here, because if it is internal to
the ACOM-2000A, it might be hard to diagnose.

The ACOM is very sensitive to coax cable and antenna switch challenges.
You should connect your ACOM directly to a dummy load bypassing all other coax stuff to ensure it is not the amplifier.

I had a similar challenge years ago. I found a 90 degree UHF adapter was bad...I could not find any fault using a DC ohmmeter, but when replaced all was fine!

I also had a short coax jumper with corrosion or dried solder flux on the tip. Again using a DC ohmmeter all was fine. when cleaned up the amp worked fine.

Finally check your coax switches...I had an alpha delta 1985 vintage and had arc faults...cleaning the switch and replacing the arc tube did not solve the fault..I replaced the switch with an ICE coax switch and no arc faults.

In troubleshooting an arc fault the plan is to first ensure the amp is perfect then move to your RF distribution.

Please be sure to return here and let us know what you did to solve your problem. Others may learn from your results.

David,

I concur. Often a list member describes a problem, several
options are offered and we as a collective group of ACOM owners never
know which one, if any, fixed the problem. Please let us know how
you make out, as sooner or later many of us may encounter the same or
similar problem(s)

For a more reliable replacement connector, take a look at this series of assemblies. Broad range of current, and the part is quite compact. Screw terminals on wire side, solder on PCB side (or it to can be wire connected).

A German company product, Digi Key handles similar components

Bob G4HZV helped me solve this.

To get it to remember the last displayed screen, you have to turn it off via the front panel on/off switch. Lately due to pop up thunderstorms, I've been reaching for the back ON/OFF switch. That doesn't "remember" the setting.

I suggest the Palstar AT-Tuner

Be aware Palstar has stopped selling it but not to worry
HRO AES and others still have them in stock
The tuner WILL be supported by the designer.

Without going into details here he has left Palstar and is establishing his own company to support the tuner. He will also be designing upgrade software and a matching auto antenna switch.

There is a Palstar AT-Tuner reflector on yahoo groups...you may want to join it.

From: DAVID GILLIES
Topic: 3646 Message: 3646

About 6 weeks ago after letting the amp warm up for the required time, I switched to OPER and it made a loud fizzing noise, the diplay flickered for a couple of seconds and then the whole amp just shut down. I restarted it and all seemed ok and has been fine since, the only noticeable difference is that it produces approx 200w less than before . The error code it gives is 1APR06 000000 0C481A 1B889A 6720DC D77FDE. I have'nt looked inside to see if anything obvious has happened but maybe some of the good people on here can give me a few pointers as to the problem.

From: kamarty456
Topic: 2508 Message: 3647

This is a reminder for you to clean your filter on the amplifier!

Dust build up = reduced air flow = poor cooling = potential amplifier failures!!!!

We tend to overlook cleaning the filter on a regular basis.

I clean my quite often as it's quite dusty here in Arizona. I even have a pre-filter and do not rely upon only the thin foam filter supplied.

The filters were 80% clogged with dust [3 months run time]! a few moments washing and drying them and I'll be good for another 3 months!

I'd also suggest you blow the dust out of your power supplies or any other devices that have forced air cooling. It couldn't hurt!

Hi,
When I turn on my ACOM 2000A, heater LED on RCU blinks and amplifier is turned off immediately with a warning ¡°-12V TOO HIGH-10.7V¡±.

According to the manual this fault occurs when line voltage is too high. But my line voltage is about 215V and amplifier is wired at 220V so line voltage is not actually high. I wonder why this fault happens. Please help me if there are someone who know about this problem.

Thanks,
HL5NLQ,Kang

3649. Re: Line voltage problem

Yahoo group: acom-list (2010 — 2016)

From: bobhzv
Topic: 3648 Message: 3649

Kang,

I don't have a 2000A, I have a 1000, but the fault might have a similar origin to one I had recently. The monitoring software is only as good as the metering accuracy, so if the A/D is reporting the wrong value, the main processor has no way of knowing it's wrong and just assumes it's correct and responds accordingly. So if the processor thinks the voltage is wrong, it will follow its program and turn off the amplifier.

If there are any other levels, voltages or even temperature that you can check using the amplifier's metering, have a look and see if it's reporting more of less the expected values. If everything looks right, then it's not a measurement or metering problem and I've no idea what it might be. In the case of my 1000, the A/D reference voltage was wrong, which meant all the meter readings were high, causing the amplifier to switch off (Solved by Vine Antennas' excellent engineer).

Good luck.

Hi Andrey

It looks as if neither ACOM 1000 or ACOM 1010 amps have much details in
their manual about changing the Mains Voltage. I am unsure if changing
the voltage is the same on both.

I took the cover off and here is what it looks like on ACOM 1010:

http://dx.fireroute.com/DSC_0261s.JPG

I will contact the distributor for details.

Thanks for your help

Hi Andrey,

The voltage can be changed by remove these wire bridges and re-positioning them in one of the other combinations. I do recall this is explained in the user manual on the service CD. Contact me directly for digital documents I have available.

Vy 73, de Kees.

This is not true for the ACOM 1000. Look at the simplified schematic in the Files section of this group. It has the connection matrix for the two transformers with relation to the mains voltage.

Since I travel with my ACOM 1010, I need to change the voltage selection out in the field. You never know for sure what voltage selection you need until you get there.

To change the voltage selection you have to unsolder pc board jumpers and install new jumpers in different locations. I was concerned about pulling the plating out of the holes in the pc board. Some of the pc board traces are on the bottom of the board, and field repair could be difficult.

I installed screw terminals into all the pc board jumper holes. Now I can use the screw terminals to move wire jumpers around on the board. This is relatively easy to accomplish out in the field. If you like, I have pictures I can send you.

Reminder: When you change the voltage selection don't forget to make sure you have the proper mains fuse in place.

Hi Andrey

It looks as if neither ACOM 1000 or ACOM 1010 amps have much details in their manual about changing the Mains Voltage. I am unsure if changing the voltage is the same on both.

I took the cover off and here is what it looks like on ACOM 1010:

http://dx.fireroute.com/DSC_0261s.JPG

I will contact the distributor for details.

Thanks for your help

3656. I need a simple answer please

Yahoo group: acom-list (2010 — 2016)
Date: 2010-08-25 15:06:52 UTC
From: Sonny
Topic: 3656 Message: 3656

I am thinking serious about an ACOM 1000. From what I have learned on this group the Acom does not like any line voltage about 240. My line voltage, which according to my power company is within their specs, is running between 244 to 250 volts depending on the time of day.

Am I right to assume that the Acom will not like this and without changing the transformer I have no other options?

Thanks, AB4VV.....

Not very different from my QTH. Although UK mains should be 230 V (+10% 722;6%), my local supply is often running near the +10% tolerance limit, so ~250V. RF output power changes a bit with the varying supply voltage, but apart from that, no problem. I've had my 1000 for 9 years.

The Acom 1000 has multiple taps on the power supply and can operate anywhere from +/- 10% of each tap setting. (Total operating range of 170 to 264v).

It will work fine with your line voltage set to the 240v tap.

Where did the report of it not liking higher than 240v come from? Not from Acom.

The voltage on my 1000 always runs above 240, usually about 246 or so and occasionally 250. No problem at all here with the 1000.

Thanks for the answer Bob.

One other thing that bothers me that you can perhaps clear up is that Alpha is no longer using the 4CX800 tubes that the Acom uses. They state that the supply is not there and the tubes that are on the market are from the 1970's to 1990's.

What I want out of an amp is one that will last me a very long time and if I need a new tube I will be able to get one. Also why is it that Acom says to not try and change out the tube yourself but to send the unit in for the Repair Center to do?

Thanks, AB4VV......

GU74b tubes (4CX800 equivalent) are plentiful and cheap (just check eBay)
and easy to replace in your Acom. I'm glad that's all I need to feed my
Acom 2000A and Alpha 99.

Acom recommends that users don't change the tubes to avoid problems and perhaps to avoid lawsuits. I guess they have recognized that users are generally unfamiliar with tubes and how to work with them. Not everyone who is a ham today is also technically competent they way you could presume years ago.

There is no reason to not change a tube yourself - with the exception that the tubes rarely fail, so planning on replacing a tube in advance is a waste of time and energy. For example, I purchased my personal 2000A back in 1997 and it is still running strong on the original set of tubes. I bought a spare set back then, and they are still sitting in the boxes they came in. I never installed them. There are some exceptions to this, but the vast majority of these tubes do not fail routinely or often.

I have no idea what Alpha is talking about regarding tube availability with the exception that 4CX800's have never been made in the U.S. We get them directly from Svetlana and they are indeed brand new and they cost about $500 each for brand new tubes. We also have access to matched pairs of NOS (New, Old Stock) GU74B tubes for $550 a pair, $300 each. I don't think Svetlana was in business until the 90's, so the reports of tubes being made in the 70's and 80's is a bit of an exaggeration.

So, if you want tubes, we have them.

73,

Bob W5OV

I don't
> think Svetlana was in business until the 90's, so the reports of tubes
> being made in the 70's and 80's is a bit of an exaggeration.

Svetlana was founded in 1889 and it has been making vacuum tubes since 1928. The original tube - GU-74B was manufactured for military applications in the 70's and 80s. The early ACOM amps were equipped with the mil version GU-74b tubes with datecode in the 80's. Svetlana assigned the "4CX800A" name to mimic the EIMAC naming convention (read: to make the tube more atractive to western users) and they released a "consumer" version which is labeled (on the fins) as 4CX800A and it looks a little nicer (shiny, polished anode fins) than the dull gray look of the mil GU-74b version. Exactly the same specs.
There was a period, a few years ago when there was a shortage of supply (the manufacturing was suspended) and this caused a sharp increase in prices - before then the tubes were sold for $70-$80. Currently you can get tubes from ebay for less than $200 with datecodes in the 90s. I've seen on eBay tubes with datecode 2007. So getting a fresh spare is not a big deal!
The tube is very rugged and it will go for years and years (my amp was manufactured in 2002 and still has the original tube at full output.

From: kamarty456
Topic: 3656 Message: 3664

Just to reassure the new owners of the ACOM 2000A
I have my 2000A almost 10 years! I run it every day.

I have had a few challenges with the amplifier over the years:

1. Low voltage regulator board failed under warranty
2. Bias circuit failed under warranty
3. Low air flow alarm but it was adjusted locally with good results.
The sensor pot/level needed to be adjusted slightly.

My 240vac line voltage runs a bit hot! 242-247VAC
This is well within the power companies +/- 5% rating,
or 228VAC-252VAC....The ACOM 2000A tolerates it without any problems.

When you go through the 2000A's measurements you may find it is not very accurate! I had to adjust the 2000A's line voltage indication as it read almost 7VAC high! I was concerned at first, but once adjusted to "follow" my actual line voltage I have relaxed. I also have a digital outboard in line voltmeter to monitor my 240VAC line...just to be sure!

I DO HAVE an ICE 240VAC 25amp dedicated surge protector in the
AC power line to the amplifier. This is a very good item to have!

I ensure my air filters are cleaned every 3 months and I do not abuse the amplifier. Proper air flow is critical!

I run an ICOM IC7700, Palstar AT-1, and a Sommer XP707 antenna.

I did have arc fault error codes in the beginning and found my alpha Delta antenna switch, a 90 degree SO239/PL259 adapter, and a bad coax jumper were at fault [at different times]. Upon replacing the problems items I have never experienced the arc fault error again.

Yes the cost of tubes have gone up. When I first purchased the amplifier, I was also concerned about tube failures etc. I ordered a set for Tom's Tubes around 2001. Back then the tubes were around $100.00 each.

Today there are many other European amplifiers using the same 4CX800A tubes and an artificial shortage occurred causing a tube availability panic. With the Euro and dollar fluctuations and inflation [possibly greed too] the cost of the tube has increased precipitously.

Now, look at the big picture.... the approximate cost for the 8877 tube today is around $1000.00 yikes!

The 4CX800A is a very dependable tube as the Russians used them in their tanks! They offer a very long and reliable life. Yes they are really ugly..but how often do we look at them?

If you do not abuse the amplifier you should likely see 5000+ hours of use and then you may find the output deteriorate as it gets close to its end of life. Tubes are available! so

don't panic!

Tube replacement is not that difficult; but if you are not comfortable with being inside a box with high voltage or know what to do safely..I strongly suggest you leave it to the professionals.

You do not simply pull one tube and slap in a different tube. There is a procedure that has to be accomplished and some adjustments made to the tube's electronics. This information is described with the tube replacement procedure.

The 2000A is an elegant amplifier that is tolerant of many external challenges. The design is such that it will protect itself way before it produces smoke! I find the measure sub menu very effective in monitoring the various parameters.

The only design parameter I would have liked to be included is a peak reading watt meter mode.
The other design change I'd suggest is to provide a way to replace fuses externally with rear mounted fuse holders. Presently you have to pull the power transformer etc. to replace any blown fuses. For the record I have never experienced a fuse failure so this may simply be a moot point.

A very satisfied 2000A user

I don't think I agree with the last few comments on getting a GU74B tube off E Bay. While the GU74Bs are available, they very much indeed seem to have problems meeting specs and these tubes have "been around the block". A number of European people have purchased these tubes from Russia and Germany and have tried to resell WITHOUT any form of testing them. From my experience and working with a few companies in Europe, obtaining one good GU74B out of six is a pretty good average. Perhaps it would be wise to inquire on the reflector experience people have had going the E Bay method. Hopefully people won't mind telling us if they got a little taken. Joel, K2QBV

If you think spending 4000 dollars more for an amp that has the same power output and tubes cost 800 each have at it. The real truth is both are well built ,But they all Break and sometimes need tubes . AS many Acom that have needed warranty work I have several friends that have had the same type issues with there Alpha I have several GU 74B that I bought of ebay I paid 100.00 Tube my amp has 8000 hour and I have gone through one tube . Sorry as much as i like alpha amps they have not be that strong over the last couple years .By the way I own an Acom 1000 also . How many alpha needed new transformers ?
Acom has the quiets relays even with the aux fan its still quieter than the Big Boy amps , Its the only amp with control amp detached legal limit class . It also lends it self well to remote mounting. and is still lower cost . You have 2 years on tubes 4 years on the amp. GU 74 B it a no issue on this reflector .

Subject: [acom-list] Re: I need a simple answer....GU74B tubes

I don't think I agree with the last few comments on getting a GU74B tube off E Bay. While the GU74Bs are available, they very much indeed seem to have problems meeting specs and these tubes have "been around the block". A number of European people have purchased these tubes from Russia and Germany and have tried to resell WITHOUT any form of testing them. From my experience and working with a few companies in Europe, obtaining one good GU74B out of six is a pretty good average. Perhaps it would be wise to inquire on the reflector experience people have had going the E Bay method. Hopefully people won't mind telling us if they got a little taken. Joel, K2QBV

Hello Phil,

The warranty for an Acom amp is as stated below which is from the Acom web site. Its one year on the tubes and 2 years on the amp. Not 4 years as you stated.

Warranty
Solid product backed by a solid warranty.

Standard Two-Year Return-to-Factory (RTF) Warranty

ACOM stands behind all its products with a two-year warranty. If your ACOM product fails at any time during the coverage period, ACOM will repair or replace the unit. Your only responsibility is prepaid shipping back to our service center. Warranty coverage for tubes is one year.

The ACOM distributors may extend the warranty period.

Not exactly eBay, but I searched the Web and found a tube seller in Russia. I had zero information on his reputation but he seemed responsive and said the right things via email. Over several transactions, I bought six NOS GU74b tubes. Every one tested fine. I also tested them in pairs in my 2000A. I could combine ANY two tubes (out of the six) at random and still meet Acom's spec for tube pairing.

So, based on my experience, I can't help but raise my eyebrows at those who think it so difficult and expensive to re-tube their Acoms.

One out of six a pretty good average? I find that VERY hard to believe.

Understand for I have a Acom A2000 also. However, the GU74B tubes are not covered in the four years of warranty. Actually, my point was to indicate that some tubes purchased off E bay are not very good. Joel, K2QBV

From: Hal Kennedy
Topic: 3672 Message: 3672

I'm with Barry, I have had not trouble obtaining GU-74bs (which I prefer to 4CX800s). Vine Electronics and Kees provide them from time to time - when you see them pop up, grab a spare set and then rest easy. The ones on eBay from the Ukraine are all pulls and have poor track records, they come out of gear the Soviet Union left behind and were never made anywhere near there. Avoid tubes from the Ukraine. The eBay tubes from Russia are usually fine. I have bough three pair over the years which should last me a lifetime plus (I have two amps). They all match reasonably well - I have had one tube go intermittent in six years - it was one that came "new" from ACOM with the amp, it was a Gu74b. They replaced it for me with a 4CX800A. It matched the other GU74b in the amp and they both have 5000-6000 hours on them and act like new.
Hal,
N4GG

For some reason, it does not seem to be getting clearly communicated, but Array Solutions is now an offical Acom dealer here in the U.S.

As such, we honor the Acom official warranty as I quoted in my earlier email. We provide official warranty service for Acom in Bulgaria. We have a good stock of parts and as most of us know, these amps are very rugged and rarely fail, so we have not been too busy with repairs.

We also have tubes in stock. That's right - tubes in stock. We have both brand-new 4CX800's for $500 each and N.O.S. GU74B matched pairs for $550. Single N.O.S. GU74B tubes are available for $300 each. We will continue to have stock of these tubes so there is no reason to rush out and buy one now unless you have one of the rare tubes that fails. If you don't already have a failure, it is more likely that you will not ever have a failure.

We normally have all models of Acom amplifiers in stock. Sales have recently been brisk despite the economy and we currently are out of the 2000A and 1000 models but we do expect a shipment from Bulgaria soon. We have both the 1010 and the new 1011 in stock.

73,

Bob W5OV

Another factor in ACOM's recommendation may be related to IMD performance as a function of tube matching. It would be interesting to see an IMD sensitivity analysis of the ACOM 2000A as a function of changing tube characteristics.

Ten years ago, I owned an ACOM 2000A for about one year before selling it. My one and only concern with the 2000A is in its medicocre IMD performance. The 2000A should be capable of better IMD performance based on a similar architecture in the ETO/Alpha Power 91b, 99 and 8100 amps.

Today, not only can we hear the difference in IMD, we can clearly see the effect with some of the better pan adapters from Flex, LP-PAN, and SDR-IQ. I typically concentrate on the area around the carrier set point to differentiate between IMD and the transmitted passband. The differences seen in IMD purity can be significant. I have seen anywhere from roughly -20 dB to better than 50 dB using an SDR-IQ. My results are not meant to achive accuracy in numbers -- only to see the radical variation among transmitted spectrum.

No doubt QST's Product Reviews are of only one sample and their testing methodology may have changed through the years of product testing. But that brings me back to the IMD sensitivity analysis. Is it possible that the dual tetrode amps have varying IMD performance based on individual tube characteristcs, or is the IMD performance more closely related to the amp's ability to regulate the screen grid? How about dual triode amps? By matching tube gain, does IMD performance also improve? I would really like to see some tests in this area. To the best of myknowledge, it's not been published in the common ham literature before. If it has, please pass along any citations. Many Tnx!

Paul, W9AC

3679. This is not at all clear!

Yahoo group: acom-list (2010 — 2016)
Date: 2010-08-31 21:52:59 UTC
From: Sonny
Topic: 3679 Message: 3679

It seems that the warranty for the 2000 is 4 years if you buy the amp from Medfield, Ma. Below is from the ACOM website, http://www.hfpower.com/

About ACOM

ACOM designs, manufactures, sells and services RF
equipment and antennas for commercial, government and amateur markets.

ACOM, OOD, a privately owned company located in Sofia, Bulgaria,
has been developing products since 1988.

In 2000, the company introduced the automatic ACOM2000A, a new

generation of HF amplifier, followed by the ACOM1000 and ACOM1006,
and ACOM1010, which now have a proven track record for
performance and reliability and have become the preferred
equipment for DX expeditions, DXing and contests.

ACOM International, Inc. was formed in 1999 to market and service
ACOM products in the Americas. ACOM International provides direct sales
for the ACOM 2000A from its facilities in Medfield, MA, USA.

WARRANTY>>>

Warranty

Solid product backed by a solid warranty.

Standard Four-or Two-Year Return-to-Factory (RTF) Warranty

ACOM stands behind the ACOM 2000A with a four-year warranty. All other products have two year warranty. If your ACOM 2000A or ACOM 1000 fails at any time during the coverage period, ACOM will repair or replace the unit. Your only responsibility is prepaid shipping back to our service center. Warranty coverage for tubes is one year.

Rapid Swap-Out (RSO) Service

If you need instant turnaround on an amplifier, ACOM offers a Rapid Swap-Out service option. You'll have a replacement amp on-line as fast as we can get it to you. Call ACOM for details.

****
If this is not correct it needs to be corrected. Bob at Array Solution says 2 years on the 2000 and this web site says 4 years.... "ACOM International provides direct sales
for the ACOM 2000A from its facilities in Medfield, MA, USA."

3680. Re: [acom-list] This is not at all clear!

Sonny,

I am not really surprised by this, and we probably would honor it as well. The likelihood that an Acom 2000A will develop any sort of a problem covered by warranty over it's lifetime is extremely unlikely. They're that good.

The manufacturer's warranty allows for individual dealers to vary the warranty terms which Acom International apparently has done.

Oh and just to be clear, Acom International in Massachusetts is not the manufacturer of these amplifiers. They have chosen a name that could, and does, give the impression that they are related to the manufacturer, but the truth is that they are not. They're just another dealer.

All that said, Krassy and Will have done a great job representing Acom over the years and I bought my personal Acom from Krassy back in 1997 and they took good care of me too. They're busy with other things now and this is how we began to work with Acom too.

Bob, ACOM says " In 2000, the company introduced the automatic ACOM2000A"

How did you get one in 1997?

I am surprised , that Acom new Dealer does not Know his products warranty
. No matter the discussion was on the Acom 2000 A which does have a 2
year warranty on tubes and 4 years on amp . Now if you own the 1000 its
only 2 years . I have 4 buddy all have Acom 2000 A and all ours have 4 years
. If your amp doesn't then you bought amp from the wrong guy.

In a message dated 8/31/2010 10:08:28 A.M. Eastern Daylight Time,
nmbsun1@... writes:

Hello Phil,

The warranty for an Acom amp is as stated below which is from the Acom web
site. Its one year on the tubes and 2 years on the amp. Not 4 years as you
stated.

Warranty
Solid product backed by a solid warranty.

Standard Two-Year Return-to-Factory (RTF) Warranty

ACOM stands behind all its products with a two-year warranty. If your ACOM
product fails at any time during the coverage period, ACOM will repair or
replace the unit. Your only responsibility is prepaid shipping back to our
service center. Warranty coverage for tubes is one year.

The ACOM distributors may extend the warranty period.

Mine was purchased through FinFet in early 1999 right after its final development. The FCC certified the 2000A on June 22, 1999. Production shipments to the U.S. commenced late summer or fall of 1999.

I have checked my records, and I was mistaken - it was late in the fall of 1999 that I purchased mine - not 1997.

Bob, ACOM says " In 2000, the company introduced the automatic ACOM2000A"

How did you get one in 1997?

I'm also not sure why Acom says they introduced the 2000A in year 2000 as there are reviews of the 2000A posted on the Acom website from 1999 along with ON4UN's great review here:

http://www.acom-bg.com/index.php?option=com_content&view=category&layout=blog&id=37&Itemid=67

I recall reading ON4UN's review and knowing that I would purchase one as a direct result of his recommendation.

There are also reviews of the Acom 2000A on eHam.net going back to 1999.

So, I think they and I have trouble remembering exact dates.

ON4UN said and I quote "Early in 1998 I was approached by Vasko, LZ1JK, to "life" test a new automatic amplifier"

Yet when you do a search for LZ1JK you find on Ham Call:
Vassil Vassilev LZ1JK...

On QRZ. Com you find for LZ1JK:

LZ2JK ex: LZ1JK

ORLIN MISHEV

P.O.BOX 1300

1000 SOFIA,

Bulgaria

****

This sure is strange. Can you say twilight zone? LOL

I do not see anything strange?! In the CQ WW 1999 contest was the first
time an Acom 2000a was in use.

Have you read the article about ACOM factory in LZ?

3696. Acom History

Yahoo group: acom-list (2010 — 2016)
Date: 2010-09-03 12:02:02 UTC
From: Bob Naumann
Topic: 3696 Message: 3696

Acom has corrected their "About Acom" page and now correctly reports that the Acom 2000A was introduced in 1998.

http://www.acom-bg.com/index.php?option=com_content&view=article&id=46&Itemid=54

Where it now says:

"In 1998, the company introduced the automatic ACOM 2000A, a new generation of HF amplifier, followed by the ACOM 1000, ACOM 1006, and ACOM 1010, which now have a proven track record for performance, reliability and craftsmanship
and have become the preferred equipment for DXpeditions, DXing and contests".

3697. RE: [acom-list] Acom History

Topic: 3696 Message: 3697

I can fully find myself in that statement. Acom produces very high standard quality products for us Radio Amateurs. The fast majority of the HAM market is flooded with (very) low quality products and Acoms products are most welcome.

Keep this standard high Acom and we buy many more products from your you!

Missing in my vision is the 6metre lacking on the Acom 1010/1011 and a manual tune 1400 watts amplifier running two GU74B tubes. The latter may change later this year as I was informed via an Acom email!

I had an ETO 91b, built by Vasko, LZ1JK, he is suppose to be the designer of the new ACOMs. Best amp of its time. I now have the ACOM 1000. Just got the amp so I will hold off on a review but so far it is doing quite nice.

I see no purpose in going to a '1400' watt version. The gain in db as compared to the extra price is not worth it. Besides two 4CX800s would put out easily 2000 watts. At least my old 91b with the same tubes would. Besides going from 1k to 2k is just 3db or 1/2 S unit on receive...I have had several Legal limit amps but the downside of more blower noise and more problems with higher power as compared to running 1k to 1.2k is not worth the trouble as compared to the gain in signal.

3700. ACOM 1000 Specs. ?

Yahoo group: acom-list (2010 — 2016)
Date: 2010-09-06 15:39:49 UTC
From: Sonny
Topic: 3700 Message: 3700

I have a new ACOM 1000 and so far it is doing just fine. Problem is the manual. I assume that this amp, along with many new amps on the market, are aimed at the "non" technical ham. BUT< I want to know what is going on with my ham equipment. I see no reason to have an LCD meter showing me what my plate current is if the manual gives no clue as to what is normal range! Same goes for all the other specs of this amp. It gives the temp in C and F but just what are the temp limits of this tube?

I come from an era in ham radio where loading a tube amp was a thing you just took for granted with say an amp with an 8877 tube or 3-500z tube. Just dip the plate and keep the grid under a spec limit and load the amp for max output while keeping the grid under a certain spec. I knew what I was doing then and paying 3,250 for a kw amp I think it is quite reasonable to want to know what I am doing now. Don't you ?

If anyone Knows what I am talking about please be so kind as to share this info with me.

Thank you,

Sonny, AB4VV.....

Are you kidding? The ACOM amps give more information about DC and AC operating conditions than any other retail amp I've seen. If you want to find out about valve operating point recommendations then why not look up the valve data? As for the PSU and RF deck, I can assure you that it is built to easily deliver the input and output conditions necessary to feed the valve.

As for fault conditions, there is a lot more being monitored over and above the basic (but complete) parameters shown on the display. Almost all conceivable external fault conditions are checked and a good few internal ones as well. Again be assured that unexpected faults will do no harm and will be detected in an instant.

If you want to run the valve near it's maximum ratings all the time, then you will shorten the lifetime of the valve. It's not a simple equation for best use - you choose, high drive vs. long life, poor loads vs. long life, high mains voltage vs. long life, ...

My licence says only use the power level required for communication, unless you are running an AM broadcast station I would suggest that the amp will do the work for you. Just tune up and work the DX with the power level needed.

Bill, you are a great example of what I am talking about with the non tech hams. The way I read what to you told me is "just run the amp and dont worry about what you are doing, just load it up to the little arrow and forget about knowing anything else". NO THANKS> I am not an appliance op.

Sonny

I hope you get the information that you've asked for. As an owner of the same piece of equipment I've often asked myself the same questions. The valve specification will not tell you everything because I would expect the amplifier manufacturer to apply a safety margin, and we are not told what that is. No doubt there are also "recommended" and "absolute maximum" values.

And regarding the other writer who said that there is monitoring of umpteen parameters and more besides - it didn't save my Acom 1000. There was a component failure within the PA compartment very early in its life. This caused some of the protection circuitry to fail and it was "return to base". (Overdriving ? No chance, it was on standby).

Regards

John G4ZTR

You clearly did not read or understand what I said. What I am saying is that you need to understand the characteristics of the valve. The data is readily available and you can translate the data from the display into the information you require. There is no single solution to operating parameters - you need to apply your purported technical knowledge to the problem you state.

Hi - I'm the "other writer" - I have a name ;-)

Well I did say "a good few internal" (fault conditions are checked), obviously not all internal faults can be checked - for example the fault checking circuitry itself would need fault checking :-(At some point the pure quality of manufacture and design must be trusted, and when components fail early in life then warranties save the day.

Bill, some of the tech data from Svetlana about this tube is below. You will notice that the Max voltage is 2.5k. This amp of mine shows 2800! Also it says the Max output is 750 watts.

This throws all the specs of this tube out the window because the designer has put more voltage on the tube than is allowed by the tube maker.
"
Maximum ratings
DC plate voltage 2.5 kV
DC screen voltage 350 V
DC grid voltage -150 V
DC Plate current 0.8 A
Plate dissipation 800 W
Screen dissipation 15 W
Grid dissipation 2 W "

Have tried inputting enough drive to give 750W CW output and checking the anode voltage under those conditions?

Perhaps, but these things are built like tanks (and the original GU74b tube was literally designed for use in tanks by the Soviet Union.) Mine is over 4 years old and runs 7-8 hours a day, every day. I still have the original tube and it and cracks like a rifle on 160m thru 6M.

If I may be so bold, it you don't like it, why did you buy it? Seems like a lot of money to spend on an amp if you didn't research it first. I sure did, looking at manuals, photos, talking to other owners, etc. It is literally the best bang for your buck. Nothing can come close dollar per watt *and* be so reliable.

If you are going to get on a Yahoo list devoted to ACOM amps, consisting almost exclusively of ACOM owners, you ain't gonna get a lot of sympathy if you dump all over the product . . . if you don't like it, sell it and buy an MFJ with the money. You get to take them apart and look at the components a lot.

Paul,
I never said I did not like the amp. I am just asking for the specs of the amp seeing as how the designer of the 1000 is not using the specs from the tube maker.

Sonny, I really don't understand the definition of a "non technical ham". It's contradictory. The hobby is all about being technical.. You can't simplify it - and I don't want it simplified. End of.

3713. ACOM1000 Technical Data

Yahoo group: acom-list (2010 — 2016)
Date: 2010-09-06 23:34:53 UTC
From: dj3iw@web.de
Topic: 3713 Message: 3713

Hi Sonny,

when I bought my ACOM1000 several years ago my dealer asked me
if I wanted/needed the (addional) Service Information/Data. Yes I did
and so received all this additional stuff. At that time it was available
just for asking.

Amongst the data is a small text file A1000_Tube_Regime.txt. It has all
the data you are looking for.

3714. Re: [acom-list] Re: ACOM 1000 Specs. ?

Yahoo group: acom-list (2010 — 2016)
Date: 2010-09-06 23:43:42 UTC
From: Mike Harris
Topic: 3700 Message: 3714

G'day,

Measured on my unit using the '1000 metering:

Frequency 10105kHz. Antenna VSWR 1.0:1

Key down - 0W O/P

HV 2560V, Plate current 50mA, Screen current 0mA, Drive 0W

Key down - 750W O/P

HV 2200V, Plate current 570mA, Screen current 11mA, Drive 57W

Key down - 1000W O/P

HV 2172V, Plate current 650mA, Screen current 38mA, Drive 78W

Notes:

1. Accuracy of the power meter is unknown and I don't have an
external meter to check against.
2. I didn't measure the effect on the AC supply voltage under
load. I do know that when using CW at 600W and above the house
lights flicker. I might need to change the transformer tap.
3. Screen voltage from schematics in the technical supplement is
340V. At 1000W O/P screen disipation is 13.26W
4. Plate dissipation 404W

I have used my '1000 on 6M eme running 900W O/P (indicated) for
skeds lasting over one hour with a 50 seconds on, 70 seconds off
duty cycle WSJT65. The indicated air temperature never exceeded 80C
and the blower never switched to high speed.

Nothing exactly equates to the tube data sheet, however, it doesn't
look particularly stressed to me.

I've worked with PA's running a variety of power tubes including
4CX5000A's in Marconi auto tune amps, Penta Labs PL something or
other 2500W (bloody awful pentode prone to flash over until I
dropped the screen voltage to something closer to the manufacturers
max) in fact it was in a equally bloody awful amp that didn't cool
the 4CX350R drivers enough and the plating burnt off the anodes.
Distributed load wideband (no tune) 1kW Marconi amp running 10 or 12
4CX250B in push pull parallel.

In all these units tube currents varied from specimen to specimen
when fresh out of the box.

Taken from some Acom technical literature:

Protection parameters ACOM 1000

1. Cooling and exhaust air temperature. On switch-on, the fan speeds up for a moment in order to easily get started if mains voltage is lowered. After that, the fan speed is controlled as follows:

- while in OPERATE, it speeds up when exh. air temperature increases above 90C (194F). It slows down when temp. falls below 80C (176F). At 130C (266F) you'll get a warning message (still operating). Above 150C (302F) it will go to STBY.

- while in STBY, fan speeds up above 100C (212F) and slows down below 70C (158F). It will shut down above 165C (329F) but the fan will continue running with a "still cooling tube" message, until temp. drops below 70C (158F).

2. Reflected power above 300W: go to STBY.

3. Screen grid current above 80mA or control grid current above 10mA: go to STBY (but you can't measure the control grid current by the RCU).

4. Plate current:

- above 700mA: warning message on the LCD;

- above 800mA for 4s: go to STBY;

- above 1.2A: immediately OFF.

5. HV below 1800V or above 3300V: OFF (Bad mains input voltage or HV rectifier problem assumption).

6. Drive power:

- above 90W: warning message on the LCD;

- above 120W: go to STBY.

7. Power gain below 9.5dB and above 16dB: set the input attenuator (bad tuning is assumptive).

8. Arc fault: check the RF path to the antenna as well as the antenna itself for bad connections or insulation.

9. Hot Switching: check control cables to the transceiver or transceiver's RF-to-transmit request timing.

10. Low air: check whether the air inlet and exhaust openings are not obstructed, or check the blower itself.

Healthy Tube Regime Parameters ACOM 1000

During RX: +2750...2770V anode voltage; SG voltage +340V for operate and +12V for standby; Bias voltage -120V; Anode current below 1mA.

With PTT only: +2700V anode and same SG voltages; Bias voltage between -65 and -75V, set for a 70mA low-level anode idling current, depending on the tube specimen.

With PTT and very small RF drive: +2600V anode voltage, same SG voltage; Bias voltage between -45 and -60V, set for a 220mA high-level anode idling current, depending on the tube specimen.

During TX, 1000W (external wattmeter) @ 14MHz: +2380...2400V DC anode voltage, same SG voltage, and 510-520mA DC anode current. The SG current depends on the tube specimen but is usually between 10 and 20mA. The RF anode amplitude (as measured on the LCD) must be 150-200V below the measured DC anode voltage.

On higher bands, the anode current gradually increases up to 560-580mA on 52MHz and the DC anode voltage is around 2350V at the same time (provided the mains is not "soft").

The power gain on 14MHz is 12...12,5dB up to 900-950W and it slightly decreases (-0,5dB) to 1000W. On the higher bands, the power gain might increase to about +1dB.

When ACOM1000 is normally loaded and tuned, the screen current is typically zero below 35-40W drive power and it begins to flow above 40W drive. Further increasing the drive, the screen current steeply increases, saturating to about 55-60mA at a 70-75W drive level. A current limiter is involved at this threshold.

The screen current might not appear if the plate loading resistance is too low, thus the anode instant voltage not reaching a low-enough value to approach the SG voltage for a higher SG current.

Yes Sonny,

because the ACOM1000 uses a heavier mains transformer or the
other way round the 1010s mains transformer is not rugged enough.

Correct, but not only that. Beside the transformer, lots of other components are not capable of safely handling any higher output than 800 watts. An example are the relais used that switches the RF (normal type!!) and disc capacitors, coils etc.

Roger,

if you select the link directly you'll have problem (at least same to me as confirmed) but if you select the "Messages" link from the yahoo group, you are able to search as suggested by Barry.
You can browse the messages but I found this:

Re: Acom 2000 bias too low again !/ SOLVED !

Hi all !
The problem was actually an internal leak between G1 and G2 in one of the tubes. This in turn pulled on the G1 bias causing it to go far too low. The tube fault altso caused transistors Q1 and Q2 on the HVSG board (G2 regulator) to fail into short circuit.(Q1 is replaced with a higher voltage type in later production) This brought the G2 bias from 12v to 430V in STBY ! As the amp measuring sequence at startup is G1-g2 etc the RCU showed the G1 bias pull and then the amp went power off. Stan at Acom Bulgaria has been extremely helpful and has given me a lot of good support. This is great service ! Thank you Stan !
Merry Christmas to everybody !

3726. Re: [acom-list] Re: eRROR MESSAGE

Yahoo group: acom-list (2010 — 2016)
Date: 2010-09-15 16:01:18 UTC
From: la7sl Nils Petter
Topic: 3721 Message: 3726

Hi !
This was the problem in my case. A G1 to cathode leak in the tube(s) is
a more usual failure mode... A lot of the so called NOS tubes on the surplus
market develops this sort of problem. Usually this starts with gas in the tube
due to long shelf storage. Can also be caused by mechanical shock during
shipment etc. A far less frequent failure mode is an electrical fault in the amplifier
circuits. Very small leakage currents, in the order of a milliampere or less can cause
havoc in these circuits ! Methods of measurements to locate these faults are available
from a CD available from Acom to Acom owners. They need your serial number, and will
then usually send you this CD free of charge. Be aware that this amp is quite complicated !
You need good knowledge in electronics and good workshop skills to repair this one !
One example is that there is a setup procedure after changing tubes. To reach the
adjustment
points you have to remove the front panel. Do not just replace tubes without
adjustments...this
may cause everything from splatter to breakdown...
Now that you are warned, ask Acom to send the CD or bring your amp to Acom or a
professional
service-spot....
Peter

From: ea2ok
Topic: 3727 Message: 3727

Hello, I´m Juanjo EA2OK from Spain. I´m a new owner of the Acom 1000 amplifier.

What is the normal value of the High Voltage at standby mode?

Mine shows 2688V with transformer wired for 230V (the AC input in my QTH is 218/222V)

Many thanks
Juanjo EA2OK

Hi Juanjo,

My Acom is on average at about +/- 2750 volt. I was told by Acom that lower HV will result in more drive power needed and furthermore less RF output. 2688v is a bit on the low side to me. Stay under 2800 volt and you will be save.

Hi Kees and company

Initially the transformer input of my Acom 1000 was wired for 240V and so the HV value was 2576V. I got +/- 925W output power with an input of 65W.

After I changed the transformer input to 230V, the HV is up to 2688V and power is 1050W with an input of 65W. It may be a little more noisy.

I could go down transformer input to 220V, because in my QTH voltage is 220/222V, but I prefer to leave a safety margin.

Many thanks
Juanjo EA2OK

Yes and no. If you want the 1000+ watt output as advertised, one will have to match the mains voltage to the correct transformer taps. If your mains is 220-220volt, set the taps in the amp to 220v too. You have a safety margin of 10% + and -15%. That leaves more enough headroom.

It is to be discussed if one should use 1000+ watt RF output from an only 800 watt dissipation able tube, yes... On the other hand, the tube should run pretty close to 60/40% effectiveness.

Personally I have mid range 2700 volts on the FP display which is perfectly normal according to Stanimir from Acom Bulgaria, as confirmed by email. And indeed, I never run my amps to the maximum anyway...

Hi Juanjo,

The heater filament voltage is probably the most critical one. Neither high nor low is good for it, so the best option is to measure your mains supply carefully over an extended period and select the correct transform tap without attempting to leave a margin either way.

Ml mains tests out to be between 244 to 248 volts. I was told that this was OK. My resting voltage on the 1000 is between 2800 to 2900. This bothers me but ACOM says its OK. I really do not know. I sure hope this not going to ruin my amp.

I basically had a problem like you have where my mains were coming in at 252 volts. Also had the "heater light" on the PSU go on at times. Acom and the owner both confirmed that this is OK as long as your 220 volt input board on the Acom 2000A is set correctly. If you reach the 258 volts, your Acom will let you know and at that time take action to correct the input fault which is pretty much your power company. Hope this helps you.... Joel, K2QBV

Are all the figures quoted from the front panel meter or true measured values ?.
The front panel meter on the Acom 1000 (well mine) is not accurate, and even when set correctly does drift.

Hi Juanjo,

The heater filament voltage is probably the most critical one. Neither high nor low is good for it, so the best option is to measure your mains supply carefully over an extended period and select the correct transform tap without attempting to leave a margin either way.

Hi Steward,

QSK is supported but limited up to about 12wpm CW code. But you are right, one should not attempt to do QSK on these kinda relays.

It is however a terrific amp for portable usage, not something I can say about the Acom 1011...

Very few items are sensitive to magnetic fields and the field around a well designed transformer is not very strong anyway. I would not site a magnetic compass or magnetometer near a transformer but other than than I can't think of any everyday item that is sensitive. After all we live in a fairly strong magnetic field ;-)

>
> For me it´s better to have the trasceiver on the right side.....

Very unlikely. If it were to cause a problem, it would be due to induced hum from the mains AC frequency - that is unlikely as transceivers are well screened because they often contain AC PSUs already.

In the United States, the commercial mains power providers are regulated to provide 240v +/- 10%. (216 to 264v)

So, 244 to 248 is about 1.6% to 3.3% above nominal.

This is not "pretty high" by any measure.

Sonny's amp is set to the 240v taps. Acom specs the 1000 at +10% / - 15% line voltage.

From the Acom 1000 Manual, page 6:

"Primary Power: 170-264V (200, 210, 220, 230, 240v nominal taps (100, 110, 120V taps on request), + 10% -15% tol.), 50-60Hz, single phase, 2200VA consumption at rated output".

So, there is no cause for any concern about any of the issues being discussed by anyone.

From: Hal Kennedy
Topic: 3745 Message: 3745

The magnetic field from both my 2000As and an alpha 99 I had at one time (basically the same amp although the Bulgarian transformer is different than the Peter Dahl) would tear up a CRT monitor if it was within about 8 inches of the right hand side of the amps. There is a magnetic field outside the amp. In the good old days I had a Drake TR-7 with the remote VFO. If you put the rig or the remote VFO on top of the power supply, you got 597 RST reports on CW and hum reports on SSB. WRT external magnetic fields, nothing drastic ever happens, but things can happen.

Hi Bob,

+2800HV for a GU74B tube is 'pretty high'. Because it is beyond its tube specs.

Furthermore Stanimir from Acom Bulgaria adviced me to keep the HV in the range of 2700-2800 volts. So, I wonder why you stated that +2800v is considered to be 'normal' actually?

Both my Acom 1000 units and Acom 1010 were factory set to 230v. In case of a mains with 244 to 248 volt, I personally would switch to the 240v tap setting. It is extremely easy to do in an Acom 1000. That setting ensures the components are less stressed.

Sure that the Acom1000 temporary (fieldday etc) will cope with +10 / -15% conditions, that does not tell us that that these are the advised voltage settings. Adviced is to equal the mains with the transformer taps instead.

Note: the above is based on emails exchanges with Stanimir and GU74B tube specifications.

Kees,

My comments were focused on the line voltage in the United States, and the published specs for the Acom 1000 related to line voltage. Every amplifier sold in the United States is shipped with the tap set to 240v - the highest tap. And again, the Acom line voltage specs call for +10% -15%.

I would guess that Stan told you to set the tap to prevent you from making the plate voltage too high. Abuse like this happens all the time. Someone will get the idea that if they have 220v and set the tap to 200v they'll be able to run more power output. They could do this, but then it will clearly exceed the specifications and shorten the life of the amplifier.

I made no comment on the Plate voltage.

I suspect that the actual plate voltage on the tube under load is within spec and I further suspect that Acom may have measured what voltage is actually on the tube when they designed the amplifier and took the tubes' requirements fully into account.

From Acom:

"ACOM products are designed so they meet all specifications... No one of tube's parametres is exceed. It's prooved with thousands manufactured and sold amplifiers"(sic).

3748. RE: [acom-list] Re: HV normal value -- Mine is much higher

Yahoo group: acom-list (2010 — 2016)
Date: 2010-09-17 18:55:19 UTC
From: Kees - pa7two
Topic: 3727 Message: 3748

Hi Bob,

All understood. Yes, I have repaired in the past years an Acom amp or two (...) and have been in contact with Stan quite extensively I can say :-)

I was questioning you because the mains voltage & transformer-tap setting directly translates to the HV value.

So to recap, I think we both agree that one should equal the mains voltage to the transformer tap setting and the Acom unit will be absolutely fine. From a more personal point of view, try to keep the HV below 2800 volt.

Vy 73, de Kees.

Subject: RE: [acom-list] Re: HV normal value -- Mine is much higher

Kees,

My comments were focused on the line voltage in the United States, and the

published specs for the Acom 1000 related to line voltage. Every amplifier

sold in the United States is shipped with the tap set to 240v - the highest

tap. And again, the Acom line voltage specs call for +10% -15%.

I would guess that Stan told you to set the tap to prevent you from making

the plate voltage too high. Abuse like this happens all the time. Someone

will get the idea that if they have 220v and set the tap to 200v they'll be

able to run more power output. They could do this, but then it will clearly

exceed the specifications and shorten the life of the amplifier.

I made no comment on the Plate voltage.

I suspect that the actual plate voltage on the tube under load is within

spec and I further suspect that Acom may have measured what voltage is

actually on the tube when they designed the amplifier and took the tubes'

requirements fully into account.

From Acom:

"ACOM products are designed so they meet all specifications... No one of tube's parametres is exceed. It's prooved with thousands manufactured and sold amplifiers"(sic).

73,

Bob W5OV

Subject: RE: [acom-list] Re: HV normal value -- Mine is much higher

Hi Bob,

+2800HV for a GU74B tube is 'pretty high'. Because it is beyond its tube specs.

Furthermore Stanimir from Acom Bulgaria adviced me to keep the HV in the range of 2700-2800 volts. So, I wonder why you stated that +2800v is considered to be 'normal' actually?

Both my Acom 1000 units and Acom 1010 were factory set to 230v. In case of a mains with 244 to 248 volt, I personally would switch to the 240v tap setting. It is extremely easy to do in an Acom 1000. That setting ensures the components are less stressed.

Sure that the Acom1000 temporary (fieldday etc) will cope with +10 / -15% conditions, that does not tell us that that these are the advised voltage settings. Adviced is to equal the mains with the transformer taps instead.

Note: the above is based on emails exchanges with Stanimir and GU74B tube specifications.

Vy 73, de Kees.

Subject: RE: [acom-list] Re: HV normal value -- Mine is much higher

In the United States, the commercial mains power providers are

regulated to

provide 240v +/- 10%. (216 to 264v)

So, 244 to 248 is about 1.6% to 3.3% above nominal.

This is not "pretty high" by any measure.

Sonny's amp is set to the 240v taps. Acom specs the 1000 at +10% / - 15%

line voltage.

From the Acom 1000 Manual, page 6:

"Primary Power: 170-264V (200, 210, 220, 230, 240v nominal taps (100, 110,

120V taps on request), + 10% -15% tol.), 50-60Hz, single phase, 2200VA

consumption at rated output".

So, there is no cause for any concern about any of the issues being

discussed by anyone.

73,

Bob W5OV

Hi AB4VV,

That's pretty high mains voltage and HV. Stupid Q perhaps, but you have set your transformertaps to 240v setting, correct?

Ml mains tests out to be between 244 to 248 volts. I was told that this was OK. My resting voltage on the 1000 is between 2800 to 2900. This bothers me but ACOM says its OK. I really do not know. I sure hope this not going to ruin my amp.

3750. RE: [acom-list] Re: HV normal value -- Mine is much higher

Yahoo group: acom-list (2010 — 2016)
Date: 2010-09-17 20:28:30 UTC
From: Kees - pa7two
Topic: 3727 Message: 3750

Joel, CAREFULLY read below the section: "Healthy Tube Regime Parameters ACOM 1000".

Protection parameters ACOM
1000

1. Cooling and exhaust air temperature. On switch-on, the fan speeds

up for a moment in order to easily get started if mains voltage is

lowered. After that, the fan speed is controlled as follows:

- while in OPERATE, it speeds up when exh. air temperature increases

above 90C (194F). It slows down when temp. falls below 80C (176F).

At 130C (266F) you'll get a warning message (still operating). Above

150C (302F) it will go to STBY.

- while in STBY, fan speeds up above 100C (212F) and slows down

below 70C (158F). It will shut down above 165C (329F) but the fan

will continue running with a "still cooling tube" message, until

temp. drops below 70C (158F).

2. Reflected power above 300W: go to STBY.

3. Screen grid current above 80mA or control grid current above

10mA: go to STBY (but you can't measure the control grid current by

the RCU).

4. Plate current:

- above 700mA: warning message on the LCD;

- above 800mA for 4s: go to STBY;

- above 1.2A: immediately OFF.

5. HV below 1800V or above 3300V: OFF (Bad mains input voltage or HV

rectifier problem assumption).

6. Drive power:

- above 90W: warning message on the LCD;

- above 120W: go to STBY.

7. Power gain below 9.5dB and above 16dB: set the input attenuator (bad tuning is assumptive).

8. Arc fault: check the RF path to the antenna as well as the antenna itself for bad connections or insulation.

9. Hot Switching: check control cables to the transceiver or transceiver's RF-to-transmit request timing.

10. Low air: check whether the air inlet and exhaust openings are not obstructed, or check the blower itself.

Healthy Tube Regime Parameters ACOM 1000

During RX: +2750...2770V anode voltage; SG voltage +340V for operate and +12V for standby; Bias voltage -120V; Anode current below 1mA.

With PTT only: +2700V anode and same SG voltages; Bias voltage between -65 and -75V, set for a 70mA low-level anode idling current, depending on the tube specimen.

With PTT and very small RF drive: +2600V anode voltage, same SG voltage; Bias voltage between -45 and -60V, set for a 220mA high-level anode idling current, depending on the tube specimen.

During TX, 1000W (external wattmeter) @ 14MHz: +2380...2400V DC anode voltage, same SG voltage, and 510-520mA DC anode current. The SG current depends on the tube specimen but is usually between 10 and 20mA. The RF anode amplitude (as measured on the LCD) must be 150-200V below the measured DC anode voltage.

On higher bands, the anode current gradually increases up to 560-580mA on 52MHz and the DC anode voltage is around 2350V at the same time (provided the mains is not "soft").

The power gain on 14MHz is 12...12,5dB up to 900-950W and it slightly decreases (-0,5dB) to 1000W. On the higher bands, the power gain might increase to about +1dB.

When ACOM1000 is normally loaded and tuned, the screen current is

typically zero below 35-40W drive power and it begins to flow above

40W drive. Further increasing the drive, the screen current steeply

increases, saturating to about 55-60mA at a 70-75W drive level. A

current limiter is involved at this threshold.

The screen current might not appear if the plate loading resistance

is too low, thus the anode instant voltage not reaching a low-enough

value to approach the SG voltage for a higher SG current.

Any more comments Joel?

Vy 73, de Kees.

3751. I just dont know anymore!

Yahoo group: acom-list (2010 — 2016)
Date: 2010-09-19 14:28:23 UTC
From: Sonny
Topic: 3751 Message: 3751

After talking to Bob at Array Solutions he assured me that my high voltage is OK on my ACOM 1000. Yet I read the specs that ACOM sent me when I asked them about the high voltage and 2+2 does not come out to 4.

Last night I turned on the amp but did not measure the voltage out of my 240 volt mains. On the ACOM all night it measured 2900 to 2950 volts.
When I turned the amp off for the day I measured the voltage on the mains and I was getting a reading of 243 Volts. It was a cool night and no need for the central air to be running. When the central air is on my 240 mains read about 248 volts and the ACOM shows about 2800 volts.

THIS DOES NOT MAKE SENSE TO ME......

Does anyone have any answer that makes sense? I dont know about the rest of you people but 3250 is a lot of money to come out of my life savings to worry about something that does not make sense....

Sonny....AB4VV....

Quit worring about it and operate. 2800 volts isnt going to hurt anything.

I agree. My 1000 usually runs around 2850 - 2900 and it's fine. Electricity supply voltage isn't an exact science, so don't worry.

Hi Group!

I saw home made amps with a pair of gu74b running at almost 4kV. I have the winning Alpha 91b, which I run it a bit over 3kV. Solid performer and no fault in 8 year of heavy contesting.

The GU74b / 4CX800A tubes will take higher plate voltage - these tubes are very rugged and a few hundred volts more on the plate probably will not cause any problems (The *peak* anode voltage listed in the datasheet is 4kV).
The real problem with higher AC mains voltage is that it results in higher filament voltage.
In the ACOM 1000 (as in most tube amps) there is no regulation for the cathode heater (filament) voltage - a single GU74b tube pulls almost 4A (3.6A to be exact) @ 12.6V.
Voltage regulation in the heater circuit will make the amplifier even bigger, heavier and more expensive.
Most tube amps heat the cathode with AC, directly from a separate secondary winding in the power transformer. Some amps are equipped with a separate filament transformer (not the case with ACOM1000).
When the AC mains are higher than the nominal, this translates directly into higher filament voltage.
According to an EIMAC study: " A 3% increase in filament voltage above the maximum rating will result in a 50% decrease in tube life."
These tubes are not made by EIMAC but probably will follow similar principals.
The absolute maximum filament voltage for GU74b is 13.2V (nominal is 12.6V) but there is no monitoring circuit.
There is a little cover on the bottom of ACOM1000 which will give you access to the tube's socket compartment. You could check (with caution!!!) with an AC voltmeter (True RMS type), what is the filament voltage right at the socket (H1/H2), when your AC mains are at their highest voltage. If you get reading less than 13.3V you should be OK.
If it is more than 13.3V and you are also set at your highest voltage tap on the power transformer, then you are risking the tube's life-span.

Hope this helps.

Hello Andrey,

On the display of the Acom 2000A's RCU it is possible to monitor a lot of internal measurements, with a maximum of two at the same time.

The Filament Voltage of my 2000A often is around 13.2 Volt. According to Acom (and other technicians) it is better for the tubes to have a bit higher Filament Voltage then lower. But always within the safe margin of course.

Unfortunately you cannot set the 2000A at 230 Volt, which is the supplied Voltage in my country. I have to choose a setting of 220 or 240 Volt. Because of the Filament Voltage (what I wrote above) it is better to set the 2000A's transformer at 220 Volt instead of 240 Volt.

I drive my 2000A for more then five years now, at almost every QSO, with the same set of tubes and the gain still is around 15 dB.

BTW; my second (manual) amplifier will be this one:
http://www.remeeus.eu/amateur-radio/linears/amplitec-hf50-1001200.html
With the cheap GS35b triode this amplifier gives 1,5 kW.

Hi Hans,

My amplifier is ACOM 1000 but to be honest, I never checked my heater voltage - my power transformer is set for 240V and fortunatly my AC mains vary only from 238 to 243V. I know that 2000A can measure the heater voltage, but not sure how accurate is that built-in meter. (for instnace the built-in wattmeter in my ACOM 1000 is not very accurate). I would think, when ACOM says it is better to have a slightly higher filament voltage they use 12.6V as reference and probably have 13.3V+ trigger an alarm/protection - again - I have 1000.
Btw this amp you are refering to looks very nicely built - what is their availability and cost (even roughly?). Are they sold in US?

Hello Andrey,

I agree that the built-in metering will have a degree of tolerance. It gives us a reasonable impression of how our amplifier does his job.

The delivery time of the Amplitec amplifiers is a few weeks. Pal Toth has manufacturing on demand and he is very flexibel; it is a very small company. He has a very long and wide experience in building amplifiers (HF and VHF) and his service is excellent! The amplifier shown on my internetsite has about the same price as an Acom 1000. They are not sold in the US through an agent or such, but only through direct sales at Amplitec in Hungary. One of the major reasons why I will buy this amplifier are the tubes; e.g. the triode GS35b is very cheap and has an excellent availability. When you are interested in SSB audio quality then 1 triode tube in your linear amplifier is your best friend!

3762. ACOM1000

Yahoo group: acom-list (2010 — 2016)
Date: 2010-10-10 05:34:10 UTC
From: Óscar Luis Fernández Lanza
Topic: 3762 Message: 3762

Hello, [EA1DR Óscar Luis]

I am the owner o fan ACOM 1000 but for the last month the amp is giving some troubles. Let me explain:

I swhich on the amp, wait for the 3 minutes, I start loading the amp with 20watts on a particular frequency when I press TX on RTTY with those 20watts the amp beggins selfprotecting and the yellow ATT led goes off; I release TX and press it again but it keeps protecting and I am simply using 20w.

After several times trying and slowly increasing exciter power, the amp seem to beggin warming up and start to work normal. I rise the exciter up to 80-90 watts and the amp runs perfect 1Kw. If I keep calling DX or maintaining a QSO the amp delivers the 1Kw with no problem.

But when I finish de QSO and I leave the amp in stand by no matter how the OPER button is on or off; when I excite the amp again for a new QSO or DX call alter 1 or 2 minutes, the amp does no react delivering the 1Kw at once (the rig power remains 80-90watts as when I loaded it) and the amp beggins delivering power like step by step, for example 120-200-360-400-500-670- and afther a three or four wissels (which takes me around 10 seconds) the amp goes up to the 1KW and as long as I keep it working the amp delivers full power. But if I decide to take a 3 or 5 minutes brake, when I come back and apply the same 80-90 watts of drive, the amp reacts delivering power step by step requiring me to wissel once again until full power is achieved

Dear friends, English it is not my mother tongue so I apologise for the mistakes I might have wrtiten down and hopefully you will be able to help me with my ACOM1000.

NOTE:

1) it happens in all bands, I always use RRTY to load the amp

2) All coax are ok, ALC and relay cables are conected to the rig

3) It happens with all my antenas (yagi, rigid dipole and wire dipole)

4) it hhapens with both my IC775DSP and YAESU FT1000mkv

5) SWR when keying down it ranges (1.2-1.7)

6) When I use RTTY the ATT protection goes off, if I do it myself SSB saying heeeello, heeeello, the ATT protection does not goes off

I dont have any idea of what might be causing this failure. Any coments or help would be appreciated.

Regards

EA1DR OSCAR LUIS

First of all 80-90 watts of drive is very high. Typically 60-65W here for near 1 Kw for HF bands. If you have to drive it this hard, then the tube is likely very weak. Look at screen current, if over about 7 ma then is is being driven too hard.

I had one soundcard AFSK program that had an AF spike at beginning of the transmission. That could lead to a trip if you're driving the tube so hard.

I believe the ACOM could think there is too much drive power (with low power drive) if the tuning settings are very far off from correct.

Disconnect the ALC line and see what happens. The ACOM amp does very well without it. It could be causing the power behavior you are seeing.

Oscar
You seem to cover all the bases But i did not see where you loaded the amp into a Dummy Load ,Also You did Turn OFF Transceiver auto tuner when you were tuning this would explain why is changing . Try the dummy load first with a single cable coming from the acom 1000 . If its still not loading properly I said you have an Issue .

In a message dated 10/10/2010 1:34:20 A.M. Eastern Daylight Time, ea1dr@... writes:

Hello, [EA1DR Óscar Luis]

I am the owner o fan ACOM 1000 but for the last month the amp is giving some
troubles. Let me explain:

I swhich on the amp, wait for the 3 minutes, I start loading the amp with 20watts on a particular frequency when I press TX on RTTY with those 20watts
the amp beggins selfprotecting and the yellow ATT led goes off; I release TX
and press it again but it keeps protecting and I am simply using 20w.

After several times trying and slowly increasing exciter power, the amp seem
to beggin warming up and start to work normal. I rise the exciter up to 80-90 watts and the amp runs perfect 1Kw. If I keep calling DX or maintaining a QSO the amp delivers the 1Kw with no problem.

But when I finish de QSO and I leave the amp in stand by no matter how the OPER button is on or off; when I excite the amp again for a new QSO or DX call alter 1 or 2 minutes, the amp does no react delivering the 1Kw at once (the rig power remains 80-90watts as when I loaded it) and the amp beggins delivering power like step by step, for example 120-200-360-400-500-670- and
afther a three or four wissels (which takes me around 10 seconds) the amp goes up to the 1KW and as long as I keep it working the amp delivers full power. But if I decide to take a 3 or 5 minutes brake, when I come back and apply the same 80-90 watts of drive, the amp reacts delivering power step by
step requiring me to wissel once again until full power is achieved…

Dear friends, English it is not my mother tongue so I apologise for the mistakes I might have wrtiten down and hopefully you will be able to help me
with my ACOM1000.

NOTE:

1) it happens in all bands, I always use RRTY to load the amp

2) All coax are ok, ALC and relay cables are conected to the rig

3) It happens with all my antenas (yagi, rigid dipole and wire dipole)

4) it hhapens with both my IC775DSP and YAESU FT1000mkv

5) SWR when keying down it ranges (1.2-1.7)

6) When I use RTTY the ATT protection goes off, if I do it myself SSB saying heeeello, heeeello, the ATT protection does not goes off

I dont have any idea of what might be causing this failure. Any coments or help would be appreciated.

Regards

EA1DR OSCAR LUIS

Has anyone created an easy solution so that when the remote control has "powered up" the 2000A... that an external relay is closed??? (not the AC on the front)

I am enclosing the 2000A in cabinetry and I need to increase the cooling fans speed to accommodate the additional air requirements of the 2000a when it is powered .

Hello to the group members,

in the next days I w`ll get a IC 7700 with 200 w output. Sometimes I
do not use the amp. In this case, it is possible, to drive the IC 7700 with 200 W? Or is than the 2000A damaged?

73! Hubert, DJ9JX

I think that Hubert means in the Standby Mode or with the Acom 2000A
completely switched off.

In the past I used a FT-1000D and FT-1000MP Mark-V with 200 Watt output
and never had any problem with the Acom 2000A running this kind of
output, when the 2000A was switched off.

Perhaps that there is a difference between Standby and Off...

I will ask Stan from Acom today, but perhaps that other in the group
have information.

Hi Hubert,

I use the IC7700 and the ACOM2000A since more than one year.
There is no problem to drive the IC7700 with 200W and the ACOM2000A in stand by mode.

If the amplifier is in Stand-by (ON) it may report an overdrive condition if you exceed 200 w.

There is no harm done however.

This is precisely what it will do. I get that with my Icom 775 at 200w. Obviously 200w in run mode is not good, but thankfully the 2000A is smart enought to protect us from our inevitable stupidity! HI!!

Hi

The official answer is on the acom2000A protection.doc.

2(a). FWD-P and RFL-P trip above 203W during standby. Bypassing up to 200W forward and reflected power through the amplifier in STBY and OFF mode is safe. A warning is issued in STBY at 203W threshold to secure amplifier's bypass circuitry safety. With 200W-transceivers you may overcome an eventual warning by reducing the power of about 5-10% or so, when the 203-watt threshold is exceeded accidentally.

Please note that switching off the amplifier does not resolve the problem, as the amplifier only could not tell you that the power is too high for it's bypassing relay, and a risk of a damage still exists with more than 200W. If you need more power with the amplifier off, you should reconnect the input and output cables leading to the amplifier, in order to take it out of any transmitting path for more than 200W.

Hi all,

I could agree on this 'simple' statement under one condition... --> Only when the SWR on the coaxial cable between amp and the antenna is low... Because when the SWR rises, the RF voltages rises as well at the bypass circuitry...

So having that in mind, I think it is fair to say that either the bypass circuitry can handle significantly more RF than 200 watt or the SWR issue raised above was not considered in Acom's answer?

3778. Idling Current Adjustment - Acom 1000 question

Yahoo group: acom-list (2010 — 2016)
Date: 2010-11-20 04:20:16 UTC
From: nmbsun1
Topic: 3778 Message: 3778

Not that I need to replace my tube but just to check the bias on it I checked in the file section on the 1000 tube replacement. What I found was to set the LCD to Plate Current and adjust R2 (Bias2) and to adjust to between 200mA to 240mA with 1 to 5 watts drive. And then R1(Bias1) to read 60 to 80 with NO DRIVE.

I checked my amp and with 5 watt drive the LCD is showing 260mA. And with no drive the LCD is showing 0mA. Is this normal?

My amp is about 3 months old with no problems so far.

73, Sonny AB4VV

I think you have interpreted "no drive" as the amp not being in xmit mode.

The 50-80 ma spec is for the amp in tx mode (keyed) but with zero drive power.

The amp needs to be keyed but no drive to check the bias current.
It should show no bias current unless keyed.

Tnx Brian and Jim,

Keyed with no drive shows 70mA. Right on the money.

Not use to keying an amp with no drive! So it had me confused.

3782. Acom 2000A input relay closed it should be open, screen voltage on before timeou

Yahoo group: acom-list (2010 — 2016)
Date: 2010-11-20 18:31:13 UTC
From: dl2cc@yahoo.de
Topic: 3782 Message: 3782

Hi guys,

it's one week to CQWW CW and our Acom 2000A just died!
Please help.

I've just switched on the amp like normal, then at the end of the switch on countdown I could hear a rather unusual noise ("clack") and smelled something burning, then the display showed:

Input relay closed it should be open

After turning on the amp. again it now stops at the end of the switch on countdown and shows:

Screen voltage on before timeout over

Please help, is there any chance I won't have to operate QRP in CQWW?

Topic: 3783 Message: 3783

Hi Folks,
I'm considering the Acom 2000A. One of my favorite antennas for 80 is a 135 ft wire (inv vee configuration) fed with 300 ohm ladder line, through a balun near the shack, then a short section of RG-8 to the tuner. I now tune this with an old Drake MN-2000. I'm thinking that the Acom internal tuner would not be able to handle the range of SWR this antenna would present.
Do many Acom 2000A owners also use an external tuner? If so, what model? Seems it would have to be an autotune to give the operator fully automatic frequency changing. What's been the experience with using the Acom with that type antenna? Thanks for info.

Hi Ed

Running a long G5RV (63m Antenna length and 19m ladder line) as inverted-vee with an ACOM2000, no problem to match on 80m with the internal tuner of the ACOM2000.

I'd say that if you start stretching 2:1 SWR, you ought to have a high powered manual tuner in the shack - or make your own.

If you are single-band, you can tailor the antenna, ladder line, balun and feeder for low SWR at a certain point on the band but your SWR will rise dramatically each side of that point (of course, you know this). Acom 2000 will actually handle a return power of nearly 600 or so watts before shutting down but this can't be doing any good to a number of devices in the chain.

I have worked a big doublet via a manual tuner via 450 ohm ladder line for 40, 80 and 160, it was the perfect all-rounder.

Palsar (I think) make a rather good manual tuner quite ecconomically.

Hello Ed,

I use a 410 feet Delta Loop with 150 feet ladderline. To tune this antennasystem for 160-10 meters I use the magnificant symmetrical PA0LL LL-Tuner; http://www.lltuners.nl/

The Acom 2000A cannot *tune* antennasystems. What it can is trying to find a match between the coaxcable of the antennasystem and the linear amplifier (both are 50 Ohm). Not more, not less. When there are standing waves on the coax cable of 3:1 or less, the Acom 2000A is able to bring this back to safe proportions, in order to protect the final stage (amongst other things the tubes) of the linear amplifier.

When the length of your antennasystem is tuned for *one* band (e.g. as you mentioned: 80 meters), or in other words: the impedance at the end of your ladder line on 80 meters is average around 50 Ohm, then a 1:1 balun between the ladderline and the coaxcable is the right way. The Acom 2000A will settle a minor few standing waves on the mentioned coaxcable. But this is for one band only.

Multiband antennasystems are much more complex... When you are using ladderline after you inverted-V, which is an excellent idea, than you better use a symmetrical antennatuner to tune the system in order to get the best results/effectiviness.

Sorry for my bad English; it's not my maiden language (that is Dutch).

From: Bob Naumann
Topic: 3783 Message: 3787

I had used an MN2000 with my Acom 2000 for a long time.

I swapped it out for an MN2700 to get 160 coverage. I think the MN2000 is a better-made tuner overall, but no 160.

There's no reason to not use the tuner with the amplifier. The MN2000 will easily handle the power and present a good SWR to the amp.

You'd have to "tweak" the tuner if you run up and down the band as you have to now without the amplifier, so there's really no difference whether you're using the amplifier or not - the tuner will still do the same job.

With a tuner, the match bandwidth of the antenna is relatively narrow so you will be adjusting the tuner as you QSY. If you don't, the reflected power will go up, and when high enough, the amp will trip out. Adjust the tuner, and put the amp back in operate mode, and your back in business.

Sounds like a good idea to me.

73,

Bob W5OV

Hi Bob,

I have been using the MN2700 with the Acom 2000a for years with great success. My antenna is a 260' zepp fed with 40' of 400ohm ladder line into a DX Engineering 9:1 balun and coax into tuner. Some say this may not be a perfect antenna but what is. The impedance on 75m is very low around 3-4ohms and the tuner tunes if just fine while others do not. On the higher HF bands iT becomes easier to tune and at 10m is almost flat and of course becomes and end fire antenna with gain. I use the switch on the tuner to insert either that antenna a log or a 1kw dummy load. The Acom is very happy with this arrangement.

Hi Ed,
I have an inverted V for 80 meters which is matched on ssb portion (3750 to 3800 with 1:1.2). On the cw section (3.500-3.550) I am using the same antenna throught a MN2700 Drake tuner on my shack. It works perfectly with my Acom 2000 carefuly adapted to not exceed the 1 kw. Not RF feedback, RFI and the tuner seems to handle that power pretty well. 73

3790. Tuners, etc

Yahoo group: acom-list (2010 — 2016)
Date: 2010-11-23 13:27:24 UTC
From: Hal Kennedy
Topic: 3790 Message: 3790

A few things....

This is somewhat semantic, but the 2000A does not have a built-in antenna tuner. It's got a standard PI network output that matches the tube plate impedance (about 2500 ohms (resistive)) to 50 ohms or what's needed up to 3:1 SWR. When you hit auto-tune it tunes the PI network for you - but it can also be run in manual mode. Antenna tuners work in the opposite direction. They take antenna impedances (complex impedances, R and J) that can be hundreds of ohms (or a few ohms) and transform them to 50 ohms for your rig or amp.

The spec on the 2000A is 3:1 SWR Max. At 1500W output both my 2000As trip to standby at 3:1. You can run higher SWR at lower output power....the amp is only concerned with what's reflected back. Less forward output, less reflected.

I use Ten Tec 238B tuners. The new model is the 238C. They won the QST shoot-off several years ago among high power tuners and they work FB. They will take 1500W steady state and tune out more than 6:1 SWR on any band without getting warm. IMHO if your tuner has a fan - that's the sign of a poor design. If they are efficient they don't need a fan. The Ten Tec is an L network which I much prefer to a PI network: Two knobs instead of three, only tunes at one setting. PI tuners have three knobs or cheap-out and replace the rotary inductor with a tapped inductor and switch that is very failure prone. PI tuners will usually tune to 50 ohms at two different settings. One is what you want, the other is highly inefficient and produces huge voltages at the switch if it has a switch. MFJ makes a PI high power tuner that you can arc and destroy the switch running 60W if you follow the original instructions, as they lead you to the wrong of the two possible set points. The instructions have been rewritten lately to fix this.

I would avoid "automatic" antenna tuners in the KW+ range. They switch internal components via relays - more failure points. Also, if you are SO2R or in a multi transmitter location (field day?) the power coming back down the line from other transmitters will fool an auto-tuner.

The 80M antenna here just happens to also be an inverted vee fed with open wire line to a balun. The open wire line was trimmed to be an exact 1/2 wavelength - the coax side of the balun is very close to 50 ohms and no tuner is required (in the CW band). Up on SSB I use one of the Ten Tec tuners and I can run all the way to 4.0 MHz but have never felt the urge :-)

Hope this isn't too much info.

Thanks Hans,

LL tuners are great. I actually used shorted open wire line stubs here at the end of the open wire line transmission lines, and tap the stubs at the 50 ohm point with a relay and balun. It works FB. I need to use coax to get to the house, as there is a lot of antenna switching in the backs yard, etc. The coax to the house is heliax. Between the heliax and the OWL, losses are very low.

Still wish I could have a tower! :-)

From: Franki ON5ZO
Topic: 3790 Message: 3793

For the second time in 4 days of operating, I had a strange problem with my ACOM 1000.

The amp was powered up and in stand-by. When I wanted to use it, I press the 'operate' button. Immediately thereafter I get a blinking display, with an error message - but I don't have the time to read it since the amp shuts down ('power off' mode). I think the error message says something like 'shutting down' and something with 'protect' but I may be wrong since it goes very fast.

When I re-power the amp right after it shut itself down, the warm-up time is only 20-30 seconds and I can use it like nothing happened.

Does anyone know what might be the cause? It never happened in almost 5 years of using it, now 2x in 4 days...

Franki,

Before you hit the Operate button, step through the readings and check the HT voltage and temperature. I had a similar problem with mine. The metering circuitry was reading high, so the processor thought the HT exceeded the trip level and the amp turned off.

If you can get it to stay on in "operate," go to the measurements section and measure "bias." It should be around -127 volts. With the amp just sitting there in operate but not keyed, watch that value for many minutes. If it fluctuates at all, you are probably in the process of losing a tube.

There are many other possibilities of course..

'operate' button. Immediately thereafter I get a blinking display, with an
error message - but I don't have the time to read it since the amp shuts

down ('power off' mode). I think the error message says something like
'shutting down' and something with 'protect' but I may be wrong since it

goes very fast.

When I re-power the amp right after it shut itself down, the warm-up time is
only 20-30 seconds and I can use it like nothing happened.

Does anyone know what might be the cause? It never happened in almost 5 years of using it, now 2x in 4 days...

The metering A/D reference voltage was wrong, so all the meter readings were wrong. Vine Antennas' man fixed it for me.

You can read out the last error code which will tell you the reason for the fault.

Great, I dug up the manual and the two last (identical) errors were
1APR06 000000 000306
1BA697 6720DC D77FA6

2APR06 000000 000166
2BA595 6720DC D77FA5

Decoded per the manual:
PR0 = test while entering operate (exactly what triggered the error)
#6 = "plate current (ipm)" >> what's up with that?
Followed by the values for which the manual does not give an explanation of the code, but refers to an Excel sheet. Anyone?

Should I worry? I'm only familiar with solid state devices, not with tubes. Plate current = 0mA when stand-by, 10-20mA when active but unkeyed (display value toggles, but mostly 20mA), 570mA for 1kW RF out.

According to the ACOM decoding sheet, trip value for plate current is 25mA.

When the amp has been off for a while, after warm up the plate current is
10mA.
After 10-15 minutes *in the operating position* (but no drive) the display
shows a plate current of 20mA already.
It seems that after a longer time this value goes up unil it is (or at least
measured as) 30mA. Then display toggles between 20mA and 30mA. I can still
use the amp. However, putting it into stand-by and then push the 'operate'
button to re-activate, makes the amp trip as designed.

I don't think it is a faulty tube so replacing it seems useless?
Whan can cause the current to rise? Or is it the ADC that 'measures' too
high, as brought up by Bob G4HZV? If so: can I adjust this myself? I don't
have the schematics.

Timing for this problem is very bad with CQ WW CW just around the corner...

Franki,

I think you need to adjust the idling current. If you find the tube replacement instructions, there's a copy in the Files section, it tells you how to do it. Be very careful, you need to defeat the safety interlocks, so just adjust the two potentiometers and watch where you put your fingers.

Hi Bob, Franki,

10-20ma in idle is fine. 570ma under 1KW output is fine too. Very slightly increased idle current due to heated up components I have seen before too.

My advice: Leave the amp switched on for some time (few minutes) on idle current to let the components heat up a bit, and only then do the idle current adjustments. (Both the idle and 5 watt RF current check).

3812. Acom 1000 - faulty input SO259?

Yahoo group: acom-list (2010 — 2016)
Date: 2010-12-02 13:31:36 UTC
From: stewart
Topic: 3812 Message: 3812

Hi,

Last time I tried to operate through my Acom 1000 I got infinite swr whether the amp was on or off. A meter between the centre pins of input and output sockets shows high R in the region a Megohm; between the centre of input and chassis I see only a couple of ohms but when I operate the ptt this goes up 50 ohms (the grid swamp resistor?) so it appears and sounds as if the input and antenna relays are working.

To me it looks as if the input socket has gone bad. To get at it you have to remove what I assume is the tube deck; I have no technical experience of high power amplifiers and wonder if this is something I could reasonably expect to check myself.

Appreciate any help/advice.

Stewart,

I think it's unlikely to be the socket. The centre terminal is made from a lump of plated brass and it's unlikely to fail. It doesn't sound like a dry joint either, because stuff happens when you operate the relay. I reckon it could be the output relay, because that's in circuit when the amplifier is in standby mode and you can't see a connection between the input and output. I think there's a history of them failing.

My amplifier is a working version (!), and it also does no have DC continuity between the input and output center pins. It sounds like you are in need of the circuit diagram.

You say you get infinite swr - where are you measuring this, on the drive transceiver ?

Suspect your patch lead first.

John,

Good point, well made. Yes, there's are 6 x 10n paralleled capacitors, shunted by a 1 meg resistor in series with the output socket, so the lowest straight through DC resistance will be 1 Megohm.

Sorry Stewart, I missed that when I glanced at the circuit. It sounds to me like the relays are OK. Are you sure that your RF connecting leads are OK?

John, Bob,

Patch leads were the first port of call. The circuit diagram in the handbook seems to indicate a straight through in standby (to the output relay at least) but it isn't that clear in and around the input area so may be a blocking cap in circuit there. The relays sound ok but no guarantee there's contact being made! In receive, and with a tested patch lead, sigs are heard but way down and the K3 indicates infinite swr txing through the amp in standby with a dummy load on the output.

Thanks for the input.

73,

Stewart, GW0ETF

From: lx1no
Topic: 3817 Message: 3817

Hi,

After the heat up period, I get a HV TOO LOW AT POWER ON: 0.97 kV message. Any idea what could have gone wrong? As soon as the timer reaches 0 and the relay switches, it switches off.

73 Norby

Sorry - wrong key pressed...

As I was trying to say, a few minutes with the lid off, the circuit diagram and a multimeter checking around the vacuum relay convinced me that everything was working 100% (and found out why the 1Mohm reading..;-)and that there was no reason why it *shouldn't* be working. The reason for my problem I discovered to be the centre pin of the patch lead PL259 in the RF IN socket was loose in the socket and not making good contact. Suspect I may have had a slightly oversized plug in there sometime and it has widened the receptacle in the socket by a tiny amount, but enough to give trouble. One advantage of N-types?

So both John and myself in the end were right but all is well now. Appreciate your support...

That is a very common failure mode with PL259/SO239 (male/chassis female)
I have seen this problem many, many times !
I do not understand why the amateur market is still using them as a standard !
Another thing : Once upon a time it was called "UHF connector " ...
but 100Mhz was UHF at that time :-) - - - a PL259 is completely useless already
well below 70 cm !!

The most common problem is the 'type' of PL-259 connector used to hookup to the coax. In general, the cheap non teflon types are the onces with the non correct diameter. Buy Amphenol (R) silver plated or at least the teflon PL259 type connectors and do not end up the solder project with a massive large & over-sized blop of solder on the tip!

NOTE: Do not forget to solder the braid too!

Hello Nils,

I am "screeming" this for many many years. I really do not understand
why manufacturers still use those CB-plugs. Even very expensive rigs
like the IC-7800 have those kind of cheap connectors.

N-connector are much much better and the price is okay. I buy *new*
N-connectors of very respectable brands like Rosenberger and Suhner for
2 Euro (= $3).

When I am able to replace the CB-plug by a N-connector I do this with
every device that comes in my hands.

Hello Stewart,

September 7th 2009 I wrote the underneath message in this Acom group:

The SO239 connectors I have in my 2000A are of bad quality. The hole is
too wide for the pin of the PL259 connector. This sometimes causes an
arcing failure, while switching from receive to transmit and the other way.

N-connectors are better from different points of view:
They fit and close better.
You have less change for dirt or dust in the hole.
Their isolation is better.
They have a better and steady 50 Ohm impedance.

Nowadays the N-type connectors are not much more expensive then the
SO239 connectors. For brand new Rosenberger or Suhner N chassis
connectors we pay 2 euro. The N-type cable connectors perhaps are 2 or 3
euro more expensive then the PL259.

When you find it difficult to replace the SO239 by N-types, then use
good PL259 (e.g. from Amphenol) connectors who have a bit bigger pin
(larger in diameter). I only use this type connector (PL-7 Clamp), which
is of excellent quality:
http://www.kabel-kusch.de/UHF-Stecker/pl-7-cl.htm
http://www.kabel-kusch.de/Montagen/PL-7-Clamp/montage_pl_7.htm

I advice other users to check their connectors. They are very important
parts of the transmitting circuit! The chain is as strong as its weakest
part...

Hans,

Reason why is pretty simple, the SO259 connector is bombarded over time as an international 'standard' on almost every radio, amp etc. If the connection (solder both pin and braid, correct cut coax lengths etc) is done properly and an high quality 259 connector is used, all is very much OK for HF usage. Even on higher power like a KW or so.

Of course, using N type connector is much better. I use high quality BNC connectors for almost every connection I have in the shack. Easy to mount/unmount, solid and can handle high RF without any problem. The coax I use for such connections is double shielded teflon coax + ferrite rings to the HF filters, short lengths.

One often forgotten fact: The BNC is inside, dimension wise, an N connector :-)

Subject: Re: [acom-list] Re: Acom 1000 - faulty input SO259? - solved

Hello Nils,

I am "screeming" this for many many years. I really do not understand

why manufacturers still use those CB-plugs. Even very expensive rigs

like the IC-7800 have those kind of cheap connectors.

N-connector are much much better and the price is okay. I buy *new*

N-connectors of very respectable brands like Rosenberger and Suhner for

2 Euro (= $3).

When I am able to replace the CB-plug by a N-connector I do this with

every device that comes in my hands.

I'm not so sure. I hear stories of people fumbling around the back of a multiband rig and trying very hard to put a PL-259 into an N type socket. The results can be dire.

Care is needed when soldering a 259 to ensure that a blob of solder is not left on the outside of the pin. This would have the affect that you describe.

Regards

John G4ZTR

Replaced all 'screened wander' sockets on all radio's and an Acom-1000 with 'N' types.
The input socket on the 1000 are easy to do, the output takes a little more care.
Most radios have a two fixing hole socket but managed to get hold of twelve off E-bay
and replaced all the radio sockets. the only remaining on is on an Icom IC-706 HF output
but leaving this one so I can remember how horrible they were.

Martin, GM6VXB, VHF only

left on the outside of the pin. This would have the affect that you describe".

Precisely. It is not the fault of the SO-239 that the person soldering the PL-259 did a poor job which in turn damaged the SO-239.

SO-239's can work perfectly and last for decades if not damaged.

Oh, and Type N's that are *not assembled properly* fail more easily than SO-239/PL-259.

73,

Bob W5OV

> >
> > Patch leads were the first port of call. The circuit diagram in the handbook seems to indicate a straight through in standby (to the output relay at least) but it isn't that clear in and around the input area so may be a blocking cap in circuit there. The relays sound ok but no guarantee there's contact being made! In receive, and with a tested patch lead, sigs are heard but way down and the K3 indicates infinite swr txing through the amp in standby with a dummy load on the output.

3829. PLs and SOs

Yahoo group: acom-list (2010 — 2016)
Date: 2010-12-03 13:36:02 UTC
From: Hal Kennedy
Topic: 3829 Message: 3829

Thought I would toss my 2 cents in.

Type N is superior in my book - meanwhile everything here is type UHF and I have no problems "anymore."

When I moved to Andrew 3/8" Heliax I got a real lesson in PL-259s. A PL-259 should slip onto 3/8" Heliax. Only one brand will: Amphenol. All the other cheap PL-259s I have bought over the years have smaller ID and OD center pins. The ID of the center pin should be 1/8" but it only is on Amphenol connectors.

On SO-239s it's the same. I repair a lot of Ameritrons for friends - I usually just start by replacing both SO-239s with new Amphenols no matter what is wrong with the amp - they use junk and you can be assured a loose fit. A junk SO-239 and a cheap PL-259 will give you intermittent connections just about every time. They are temperature sensitive (particularly outside) as well, and get worse as the temperature goes down.

"Amphenol or not at all."

The other really bad hardware are the TEE and 90 degree ell UHF connectors. Anything other than Amphenol usually fails at a KW - catastrophically. I prefer not to use these - even Amphenol - if at all possible. I have several Amphenol TEE connectors in the station that have done fine at 1.5 KW - I threw away my non-Amphenols (not something you would give to a friend).

Hello Hal,

Very good advise to avoid any T and 90 degrees connectors. We have opened some of the 90 degrees connectors once and noticed the little feather... My goodness, what a junk this is. Such connectors should be worldwide forbidden/prohibited to use.

"Amphenol or not at all". Mmmmm... Did you every try the PL-7 connectors?

http://www.kabel-kusch.de/UHF-Stecker/pl-7-cl.htm

Please try and you will replace all your Amphenol with this kind of connectors. I am convinced. Those connectors really are much much better!

Hello Hans,

The PL-7 is new to me but it looks very good! I hope the dimensions of the center pin are correct..I would like to find a few in the US and make a few tests.

Hans and Hal,
They look very nice. I would like to jump in on this one. If a source becomes available I would like to participate. Possibly a bulk purchase from a European supplier make be most economical.

I doubt if that is the case what is described below. By this type of connector the metal shiney part that slides in between the dielectric and the braid seems too small in size. Look at the pics presented, the rubber sleeve is way to small in size too. One pull on the coax-cable and you have the coax cable in your hand, or only the inner conductor is still inside the connector... Not sure what the brand is, likely Chinese rubbish sold for an excessive price. Instead, search for brand 'Greenpar' if you like this kinda pressure connectors. The part that slides between the dielectric and braid is at least 5mm longer in size compared to the presented, and so is the black rubber sleeve. Holding the bread much better tightened to ensure a proper 'earth' connection.

So i.m.h.o., if an 259 Amphenol connector has to be used, use an Amphenol connector. The Silver plated version. Still available by many shops.

Note 1: One instruction listed in many how-to-manuals for pressure type connectors: Do not use too much force on the tools while mounting the parts together, the black sleeve has to do its job but much remain flexible. Between the 'nut' and connector body keep at least 1-2 mm space and make sure to check every 6 months is the two connector parts are still tightened.

Note 2: OM Hal did not describe "Do not use 90 degrees connectors". Instead, what Hal described is use only high quality brand Amphenol, which I fully agree on.

BTW I wonder what someone on this reflector meant a 'feather' inside his connector, does he breed birds inside his obsessively abandoned PL259 connectors or something? Weird!

Thanks for the insight Kees. The Amphenol connectors I like are still $3.50 in the US (sometimes cheaper) - money well spent. They are silver plated, Teflon insulation and come in a sealed plastic bag. The bag is filled with dry nitrogen - it keeps the connector and silver perfect and ready to solder with no effort until use.

I believe the feather referred to is a light spring type "connection" that typically won't handle power. The Amphenol 90 ell and TEE have the center pin threaded internally for a solid connection and usually work just fine. 90 Ells seem to be the worst of all UHF connectors. I have seen SWR creep up and then burned my hand on several at 1 KW....none of those were Amphenol.

Best of the Holidaze everyone. I hope to see you on 160 this weekend.

Hello Hal,

These PL-7 connectors are of excellent quality! The center pin is gold plated. The insulation is teflon. The construction raelly is excellent! I use a lot of these connectors for many years. Many others use the PL-7 connector and I have never heard about a problem, complaint or dissatisfaction.

As you can see on the internet site of Kabel Kusch the PL-7 connectors protect very well against moist (damp?), dirt, dust, etcetera. It is about the same construction as N-connectors. Amongst other things due to the rubber ring inside the connector. All the other UHF-connectors, Amphenol included, have no such protection.

I apologize for my bad English. It is not my maiden language; it is Dutch.

Hello Howard,

Tomorrow I will visit the Ham Radio Market in Dortmund/Germany and will
ask mr. Kusch if and so where in the US you can obtain those connectors.

In example a goldplated inner 'pin' versus a Silver plated SO259 is not that good. Preferable both connectors should be of the same material. So, if the coax and chassis connector are of the same brand Amphenol, both the SO259 and PL259 are silver plated. One of the very best materials for HF type connectors.

PS: English isn't my native language either, as one likely has noticed :-) (Although I passed some English based exams with flying colors HA HI :-)

Hello Hal,

These PL-7 connectors are of excellent quality! The center pin is gold

plated. The insulation is teflon. The construction raelly is excellent!

I use a lot of these connectors for many years. Many others use the PL-7

connector and I have never heard about a problem, complaint or

dissatisfaction.

As you can see on the internet site of Kabel Kusch the PL-7 connectors

protect very well against moist (damp?), dirt, dust, etcetera. It is

about the same construction as N-connectors. Amongst other things due to

the rubber ring inside the connector. All the other UHF-connectors,

Amphenol included, have no such protection.

I apologize for my bad English. It is not my maiden language; it is Dutch.

I use this type of connector on both my RG213 and Ecoflex 15 feeders,
both inside and outside, taped and waterproofed, on the tower.
They are of excellent quality.

Tracing the cause of my recent SO259 socket problems required the covers of my Acom 1000 to come off. I have to say the innards of this amp are an awesome example of rf engineering; to me it's a work of art and I could look at it for hours.

Wouldn't it be nice if science came up with a material which is transparent like perspex but rf opaque like metal; then the covers on kit like this could be see-through, revealing it's beauty for all to see. Would you buy a Van Gogh and hang it behind a cupboard?

In the Guggenheim museum in Venice last year I came across an exhibit in the 3D (I think) section worth probably in the hundreds of thousands of euros. It was a shallow wooden box about 60cm square in which a few dozen 1940-1960 style surplus variable capacitors, or more correctly condensers, had been arranged in orthogonal patterns. Looked very striking but I did think 'I could have done that...' I suppose the value is just having the idea!

A clear case would look real nice.

I build and fix PC and the cases are getting more transparent and they do have all clear cases as well.
I like to see the stuff running inside, a few lights are cool its nice to see the fans running as they should even though
you can check the BIOS to see your rpm and temps.

I am waiting on my first Acom 2000a and cannot wait to have it in line and running like a champ.

You gents are forgetting an extremely important point here. The metal casing of the amps are there for a very valid reason... It shields the RF to the 'outside' which is generated in the amp itself!

Have fun with the Acom 2000A John!

Hello Hal,

Yesterday I asked Kusch what about a dealership (or something like that) in the US, but they have not and will not do that. They are a small family company and have no plans for international extension/growth/accretion (I don't know the right English word).

However; their PL-7 and UHF-connectors are no subject to patent, so any company in the world can make (themselve or by others) such connectors. E.g. Array Solutions, DX Engineering or ?.

Of course Kusch is kindly willing to handle international orders and send the connector(s) to you.

I hope this is of any help.

I think something similar may be found at
http://uk.farnell.com/jsp/search/productdetail.jsp?SKU=1169714 and
http://www.whwestlake.co.uk/ (ref high quality with PS gland). If you search on the part number you will find a couple of outlets in the USA but may be cheaper via Westlake.

Yes Hans.

I am sure you are correct. I should have made it clear I was referring to some other plugs, not requiring to solder the braid, which may be more easily accessible if it was difficult to source Kusch.

Has anyone have this tool working with their 2000a ?

I have the program installed with win 7, I have com 3 setup but need to confirm the cable is correct.

Does the cable need to be null modem, straight ?
what is the pin out ??

I cannot read any info from the amp plugged in. The program says port is in use when nothing
is connect to the assigned port.

Does this program support win 7 ?

The cable needs to be exactly what is specified. I believe it is only the TX, RX and GND connections, I can☐t remember the specifics. Acom uses some of the other pins to bring out voltages/signals that cannot be shorted out.

I used the Acom tools program with Writelog and my Windows XP computer. It worked just fine.

Now I upgraded my computer to Windows 7, and installed the Acom tools program. The interface works, as I can use the GUI to monitor the Acom.

I don☐t know for sure if the program works with Writelog as I had a few instances where Writelog occasionally locked up. I stopped using Acom tools and the lockups were greatly reduced.

3856. AW: [acom-list] Re: Acom interface programs

Yahoo group: acom-list (2010 — 2016)
Date: 2010-12-15 06:19:46 UTC
From: Markus Schleutermann
Topic: 3854 Message: 3856

Hi John

There are two possible solutions for software control of an ACOM2000

TRX-Manager: contains a special software called ACOM CONTROL
There is another Software called DDUTIL, offering control over the most important parts oft he linear.

But the software control part of the acom-firmware is lousy, operation is not reliable. For my remote stations I took a webcam to view the display and put web-controlled relays parallel to the push buttons of the remote control. Simple and easy, but it works !

Hi John,

I can confirm that you will need a Null modem cable, I have the Acom tools working with my 2000a. however as the others who have responded point out it hasn't been supported for a while.

I'm actually working on some new for computer control of the 2000a, once it's finished I will post it to the group.

Subject: [acom-list] Re: Acom tools installation

Has anyone have this tool working with their 2000a ?

I have the program installed with win 7, I have com 3 setup but need to confirm the cable is correct.

Does the cable need to be null modem, straight ?
what is the pin out ??

I cannot read any info from the amp plugged in. The program says port is in use when nothing
is connect to the assigned port.

Does this program support win 7 ?

Subject: RE: [acom-list] Re: Acom tools installation

The cable needs to be exactly what is specified. I believe it is only the TX, RX and GND connections, I can☐t remember the specifics. Acom uses some of the other pins to bring out voltages/signals that cannot be shorted out.

I used the Acom tools program with Writelog and my Windows XP computer. It worked just fine.

Now I upgraded my computer to Windows 7, and installed the Acom tools program. The interface works, as I can use the GUI to monitor the Acom.

I don☐t know for sure if the program works with Writelog as I had a few instances where Writelog occasionally locked up. I stopped using Acom tools and the lockups were greatly reduced.

The blinking heater light indicates that the heater voltage is close to the upper limit - nothing to worry about.

The tube temperatures should be closer together than that. It sounds like the tubes are not matched very well. He should contact his Acom dealer.

That may be an indicator to go back and reconfirm the hardware and firmware (menu) voltage tap settings (Operating Manual Sec. 2.2 "Line Voltage Selection). As I recall, the tap settings affect filament voltage as well as the high voltage supply.

> What is "bias Crunch" New term for me..
>
> Jim K4JAF

It generally refers to a non-linear PA. Typical causes can include incorrect or failed bias to the cathode in a grounded-grid amp, or to the grid in a tetrode-based amp. In amps like the ACOM 2000A and older Alphas, the bias crunch occurs for brief moments when an input detector changes bias states with the presence of RF from the driving transceiver. In SSB, the leading edge of the voice will create moderate amounts of IMD, causing adjacent frequency splatter. The stronger the signal on the band, the more pronounced the splatter.

In the ACOM 2000A, three-state bias is used. -124V on standby, -75V during plate idling, and -52V when input RF is sensed. If "bias Crunch" is heard with a normally operating 2000A, the cause is likely due to the transition between the -75V and -52V bias level. I've noticed that when the 2000A is driven by an exceiter with good IMD (e.g., TS-950SDX and Class A Yaesu), the crunch is only heard during periods of very high received signal strength.

One option for someoe willing to assume the risk with their 2000A is to either: (i) eliminate the third state; or (ii) modify the second state to allow for a bit of plate idling current. In effect, that's exactly what Alpha's advice was when owners of the 77Dx reported bias crunch from stage two to stage three. In the 77Dx, one simply turns a pot on a control board to see about 100 mA of idle plate current. Sure, the amp runs hotter that way since it's coming out of Class B. There's no free lunch. In the 2000A, the -75V level would require adustment to allow for some place current. I have no recall if that's adjustable -- or a fixed level. Easy for some owners, difficult and dangerous for others.

When I owned my 2000A back in 1999, a switching transistor failed, resulting in SSB splatter. In my case, it was easy to find the cause since I could only see two, rather than three bias levels. Replacing the transistor cured the linearity and power problem, although some IMD still occurred during the last transition to -52V.

Just my opinion, but I think Alpha has done a better job with the "linearity" aspect of a linear amplifier. There's not substantial difference between the RF decks and power supplies used between the two vendors (comparing with Alpha's tetrode models). So, there's some subtle difference that allows Alpha to achieve 3rd-order IMD numbers about 8-10 dB better than the 2000A. In all fairness to ACOM, I have not used a 2000A in a very long time. So, the issue may have been addressed a while back.

Hello Paul and group,

Last weeks I did several tests with a hardware 2-tone generator into the Yaesu FTdx5000d in Class-A, and the Acom 2000A at about half rate output power level.

Have a look at
http://www.remeeus.eu/ham-radio-english/miscellanous/acom-2000a-2-tone-test.html
This is very impressive! More than -45dB IMD3 is very difficult to equal.

I own the Acom 2000A for about seven years now. Before that I owned a few other amps like the Alpha 91b (excellent amp!) and the Alpha 87A (not convincing).

Hans,

That looks very good, and exceeds what I had measured a decade ago. While some ops may scoff at the use of a panadapter for the measurement, I'm a believer that it's valid for our purposes were extreme accuracy isn't needed. With a panadapter, it's now easy to see the upper and lower "shoulders" of the passband -- and make comparisons across stations on the band. When signal levels are strong and the band is quiet, it is quite easy to see transmitted IM effects and separate out IMD from stations that are deliberately extending RF bandwidth (e.g., ESSB).

While the measured IMD numbers look good, folks should not confuse the two-tone numbers with "bias crunch" that occurs with voice in SSB mode. What Hans' test shows is that the 2000A is capable of excellent 3rd-order IMD numbers. What is does not show is the effect of IMD resulting from the bias-state change as the amp's input RF detector is toggling bias between the second and third states. During voice transmissions, the amp is continually switching between Class B and AB, albeit quickly, but not necessarily quickly enough to avoid haring IMD artifacts. So, two-tone numbers may appear excellent, while real-world IMD is still being generated. Add into the mix the use of ALC systems across transceiver vendors and you've got some complex variables affecting IMD performance. This is not a limitation just with ACOM. It affects some other vendors/models as well.

Hello Paul,

Thanks for your very interesting message!

If someone in the group is interested in an article on this subject (transmitter (or amplifier) performance tests) he can drop me an e-mail and I send it to you.

With the increasing number of power amplifiers, and transmitters with 200 Watt output, the subject IMD-3 and 2-tone tests is very topical and important for the other users of our HF-bands.

In SSB, the leading edge of the voice will create moderate amounts of IMD, causing adjacent frequency splatter. The stronger the signal on the band, the more pronounced the splatter.
>
> In the ACOM 2000A, three-state bias is used. -124V on standby, -75V during plate idling, and -52V when input RF is sensed. If "bias Crunch" is heard with a normally operating 2000A, the cause is likely due to the transition between the -75V and -52V bias level. I've noticed that when the 2000A is driven by an exceiter with good IMD (e.g., TS-950SDX and Class A Yaesu), the crunch is only heard during periods of very high received signal strength.
>
> One option for someoe willing to assume the risk with their 2000A is to either: (i) eliminate the third state; or (ii) modify the second state to allow for a bit of plate idling current. In effect, that's exactly what Alpha's advice was when owners of the 77Dx reported bias crunch from stage two to stage three. In the 77Dx, one simply turns a pot on a control board to see about 100 mA of idle plate current. Sure, the amp runs hotter that way since it's coming out of Class B. There's no free lunch. In the 2000A, the -75V level would require adustment to allow for some place current. I have no recall if that's adjustable -- or a fixed level. Easy for some owners, difficult and dangerous for others.
>
> When I owned my 2000A back in 1999, a switching transistor failed, resulting in SSB splatter. In my case, it was easy to find the cause since I could only see two, rather than three bias levels. Replacing the transistor cured the linearity and power problem, although some IMD still occurred during the last transition to -52V.
>
> Just my opinion, but I think Alpha has done a better job with the "linearity" aspect of a linear amplifier. There's not substantial difference between the RF decks and power

supplies used between the two vendors (comparing with Alpha's tetrode models). So, there's some subtle difference that allows Alpha to achieve 3rd-order IMD numbers about 8-10 dB better than the 2000A. In all fairness to ACOM, I have not used a 2000A in a very long time. So, the issue may have been addressed a while back.

Paul, I do have some information regarding the EBS
modification..
I do have a question for you....
I appreciate your input...

I can either add a short jumper wire which will connect
the emitter of Q4, this will essentially fully block the EBS operation.
I only do SSB fidelity audio so I'm not too concerned about the
tubes operating with a higher level of idle current when the ptt
is pressed...Oh I also have the optional exterior muffin fan installed.

The second option is to add a 0.1 or a 0.22 uf capacitor
within the EBS across the original 0.1uf [100nf] in
parallel to double or triple the time constant of the EBS delay.

Either method is reasonably easy for me to accomplish...
The question is which method would you suggest?

Once I actually do the modification and determine how the 2000A
reacts [to my operating style] I'll try to provide photos and
instructions so others may have the opportunity to make this change.

From: Hank Garretson
Topic: 3880 Message: 3880

I'm delighted with my 2000A and K3. I'd like to be even more delighted.

Is there a way to have the K3 electronically control 2000A frequency-band without having to hit the key or talk? Perhaps using N1MM Logger?

Hank,

There was a DOS tool called ACOM TOOLS, I think.
People have had very little luck using it on any newer operating systems.

The ACOM2000 has a very contorted communications protocol that seems to
defy people writing control software for it. I tried without success.
The author of ACOM TOOLs essentially gave up.

This is one of the few minus "features" for the 2000A.

It requires another com port and hence you'd have to use LPBRIDGE to
share the K3's frequency.

There has been a bunch of previous postings here on that.

you'd of think by now that one of our genius comrades would have
written some app for this....

it will probably show up as an app for my cellphone; the day after I
croak.... :)...

for now it's a ptt or a dit.... it works so good,,,

it would give this amp a longer sales life, so you'd imagine that
ACOM would pay to have it done...
maybe the dit works too gud....???

Marty,

The changes seem simple enough and are minimally invasive. I would try the cap approach first before disabling EBS altogether.

Another option is to make the cap change, and also install a micro-toggle-switch at the emitter of Q4 if there's way to safely and conveniently do so right on the circuit board. That would give you the ability to enable/disable EBS, albeit rather inconveniently.

I would be careful about bringing such a switch to a more convenient location - like the rear panel. RF ingress could then affect bias if the switch lines were not adequately RF suppressed. To better deal with a remote switching point, I would use a small signal relay, controled by a rear panel switch. To preserve amp value if there's a future sale, the switch could be brought out to a pig-tail connector (rather than drill a cabinet hole) and perhaps routed out the cabinet through a small opening.

There is a utility, DDUTIL, that controls a 2000A but it is written to
work with FlexRadio hardware. Perhaps it would work with PowerSDR-IF,
LP-Bridge and the K3 but I'd have to swap my 1000 for a 2000A to check that.

Hank,

Steve, K5FR learned to communicate with the 2000A
in the development of his DDUtil program which
controls the amp nicely with the Flex radios.

He may be able to provide some help for the
Acom end.

Mel, k0pfx

Subject: Re: [acom-list] 2000A with K3

Hank,

Steve, K5FR learned to communicate with the 2000A
in the development of his DDUtil program which
controls the amp nicely with the Flex radios.

He may be able to provide some help for the
Acom end.

Mel, k0pfx

I use the TRX-ACOM program that is part of TRX-Manager to control, through my ICOM 756 Pro III, my ACOM 2000A over the internet. This setup works well and there is a TRX-Manager interface for the K3. A special adapter is needed between the ACOM 2000A and your computer. I purchased my adapter from Array Solutions. You can also build one using a circuit downloaded from the ACOM site.

Jerry -

When you say adaptor are you referring to a interface cable from the PC to the Acom ?
I made my own Null modem cable double female DB-9 plug which only requires 3 – wires soldered
and I use the Acom tools.

What is the adaptor you mentioned ?

It's called the "RPON" or "Remote Power ON" adapter.

This enables remote on and off of the amplifier. It does not make the amplifier follow the radio automatically. The amplifier still requires you to transmit to change bands.

I'm not sure why this method of band changing is seen as inferior when it requires no connection to the computer at all and works right 100% of the time. Adding software and other interfaces to the mix seems to make the 2000A less reliable rather than more.

The adapter I referred to is the "Remote Power On" adapter mentioned by Bob in the previous post.

When this adapter is interfaced with the computer and the IC 756 Pro III using the TRX-ACOM function in TRX-Manager, the ACOM 2000A band switching follows the current frequency in the Pro III, without keying the transmitter. In other words, when the Pro III changes bands the ACOM 2000A automatically switches to the same band.

Jerry,

Is that right?

I was not aware that the RPON provided that functionality beyond "RPON".

Interesting.

3893. Re: 2000A control interface

Yahoo group: acom-list (2010 — 2016)
Date: 2011-01-18 19:28:19 UTC
From: ki4ge
Topic: 3880 Message: 3893

The TRX-ACOM program in TRX-Manager transmits the information to the ACOM 2000A necessary to track the frequency of the PRO III. The computer gets its information from the Pro III. The computer is connected through the adapter to the ACOM 2000A.

The adapter provides the interface to the external remote, the computer, and the ACOM antenna switch. With this arrangement, TRX-Manager and its TRX-ACOM program will activate the remote Power on/off, On/Stby, control the antenna switching, and control band changing in the ACOM 2000A. It also permits the remote monitoring of some of the ACOM 2000A parameters such as tube temps, IP, line voltage, etc.

3894. Re: 2000A control DDUtil

Yahoo group: acom-list (2010 — 2016)
Date: 2011-01-18 19:53:56 UTC
From: dickgreen03755
Topic: 3880 Message: 3894

I've written a Windows application called AntennaMaster (AM for short) that pre-tunes the Acom 2000A when the frequency or antenna is changed. It also has extensive diagnostics for troubleshooting the amp (things like displaying all the operating parameters, displaying memory segments, dumping memory to a file, etc.) and it can automate the autotune process in a way that's similar to the old Acom Tools autotune grid (i.e., you can push a button and AM will cycle through all the antennas and segments on a band and autotune the amp for each combination.) In short, it does everything Acom Tools did, and more.

But Acom 2000A support is just an ancillary feature of the program. It's main function is to automate antenna and device switching in SO2R, M/S and M/2 contest stations. Currently it uses the Hamation Relay Driver over Ethernet for that task, but a USB relay driver kit is in the works by another developer (delivery unknown). It also supports various rotor protocols, SteppIRs and other tunable antennas, and the mircoHam StackMax. The program displays control panels at each station for antenna switching and device control.

I developed AM because my station has nine antennas in two completely separate SO2R switching system, seven rotors, a three-stack of 4-element SteppIRs on Tic rings, switchable filters and stubs, and a switchable bi-directional beverage antenna. All that has to be shared between two radios in SO2R configuration. As my station grew it became way too hard to support all that with hardware switches and diode steering logic. A software application became necessary.

Sounds great, but AM isn't generally available yet. The first incarnation, which was mainly designed for my SO2R station, has been used by me and a couple of other stations for several years. One of them uses AM exclusively for tuning an Acom 2000A amp. The other uses it for switching antennas and tuning Acom 2000As in a highly competitive M/2 station.

Unfortunately, there were significant shortcomings in AM's support for multi-op stations, so I've spent the last year transforming it into a client-server app to deal with networked stations. Most of that work is done and the program is getting very close to the point where I can release the first beta. That said, lots of work remains, especially documentation.

At this point, I haven't decided what to do with AM -- whether to sell it or distribute it for free. I've committed to offering it to YCCC members for free when the USB relay driver is available, but that's probably a ways off. At the moment, I'm trying to figure out just what AM would be worth to stations that need its functionality. I've probably put thousands of hours into development over the years, and it seems reasonable to get some compensation for that and ongoing support. Suggestions on price would be welcome.

I could put together a version that supports only Acom 2000A tuning, or could create a stand-alone app using the drivers I've written, but one of the really nice features of AM is that it tunes the amp based not only on the rig frequency but on the selected antenna. The latter relies on AM's antenna switching capabilities. It's not strictly necessary to use a relay driver for that, but you still have to select antennas using AM's buttons in order for it to know how to tune the amp. If you have only one or two antennas per band,

this isn't a big deal. AM displays only the antennas configured for the current band, and remembers the last one you selected. The Acom-only station I mentioned uses AM without a relay driver because he has the Acom antenna switch and a limited number of antennas per band.

Incidentally, the Acom 2000A communications protocol is, indeed, very obscure. But I've been able to get AM to work with it. We ran into some trouble when my Acom-only beta station tried to use it with the Acom antenna switch, but eventually we figured out how to deal with that.

Dick,

A small,simple ap (that could on/off at will) that just tunes the ACOM
would suffice here. However, it should be compatible with XP as well as
those new fangled OS's.

Now if we could just get ACOM to institute a 20db reduction in stepper
motor noise. The shack here is next to the master bedroom ....

Well, in my case it doesn't work right 100% of the time. Changing from twenty to forty, a single dit from my K3 will trip the 2000A. I've learned to hit the K3 TUNE button instead of the paddle. Other band changes work fine with a dit.

It would be nice to have the ACOM follow the K3 ahead of time.

Yes, the adapter is manufactured by ACOM and is available from ACOM distributors such as Array Solutions. A program like the TRX-ACOM in TRX-Manager, which was developed by F6DEX, is also necessary to have the ACOM 2000A automatically track the receiver and to control ACOM 2000A functions, such as On/OFF and Opr/Stby, over the internet.

> >
> > The adapter provides the interface to the external remote, the computer, and the ACOM antenna switch. With this arrangement, TRX-Manager and its TRX-ACOM program will activate the remote Power on/off, On/Stby, control the antenna switching, and control band changing in the ACOM 2000A. It also permits the remote monitoring of some of the ACOM 2000A parameters such as tube temps, IP, line voltage, etc.

I agree that band changes with a dit are NOT 100% reliable here either.
Probably 95% of the time, but that 5% is aggravating. I would like a small
interface that would watch the K3's TX frequency and switch to that segment.

You're using an atom bomb to kill a flea if you have to use all of TRX manager just to follow the rig's freq.

KISS is the answer.

3902. TS590 with Acom 1000 and 2000 - power spike

Yahoo group: acom-list (2010 — 2016)
Date: 2011-01-19 22:08:19 UTC
From: Bob
Topic: 3902 Message: 3902

When using my TS590 on CW (haven't tried it on SSB yet) with the Acom 2000 or 1000, I notice an instantaneous power spike at the start of the first character. With everything set up to run 400W, the Acom 2000 shows an instantaneous peak of 2kW on it's LED display and the same spike is visible on an external digital power meter. A similar thing happens with the Acom 1000. The TS590 is set for 25ms delay between switching on the amp and applying RF.

Does anyone have any thoughts about this please? Is it a potential problem, something unique to the TS590, or just an anomaly caused by the way the power meters operate?

I noticed the same thing here on an Acom 1000 and an Alpha 8410 amp. There is the peak at about 100 watts peak out on the 590. Evidentally the transmitt alc is not very efficent on the 590.
I got rid of the 590 as none of my Icoms or K3 has this probem.

This is caused by the ALC power regulation loop. There are two ways of adressing this:

1. Always run the set at full output, and use an attenuator to adjust the drive power.

2. Apply a constant DC (negative) to the ALC input of the transceiver.

The best way of course would be to remove the ALC loop all together and use an open-loop power regulation.

Correct.

ALC should only be used with exciters who have tubes in their endstage,
or when you use a linear amplifier with semiconductors like FET's.

New TS590S firmware V1.02 released today by Kenwood is said to be solving the spike problem and few other bugs, too :-).

Visit www.kenwoodusa.com and dowload it for free.

The CW RF waveform should be validated with a scope to ensure they did not introduce any new keying artifacts while attempting cure another.

I would not suggest either of those two methods. I would first try the firmware fix and validate the CW RF waveform, especially for sharp spikes that may not be immediately visible unless using a fast storage scope.

Notwithstanding a possible firmware fix, the cure for the TS-590 is simple: In CW mode, simply turn down the CARrier Control until minimal ALC action is displayed on the TS-590 meter. The power spike will disappear.

I'm driving my 2000A with a TS590S. The radio offers a choice of settings for the amplifier keying line. The quietest one (for QSK) has a maximum rating of 12V at 10ma. I can't seem to find any information on the spec for the Acom keying line. Can anyone tell me if this settingis going to work or do I need to use the bigger relays in the TS590S?

Bob,

Get out your VOM. Measure the voltage on the key in jack. Then use the
millimmeter scale to measure the current flow when the center conductor
is shorted to ground.

Date: 2011-01-24 07:01:58 UTC
From: Hans Remeeus
Topic: 3911 Message: 3913

Hello Bob,

The electrical specifications of the Acom 2000A's input (KEY IN) are:
- Switching Voltage (open circuit): 15V max., plus to ground
- Closed-circuit current: 15mA max.

The electrical specifications of the Acom 2000A's output (KEY OUT) are:
- Switching Voltage capability (open circuit): up to +50V
- Switching current capability (closed circuit): up to 20mA
- Resistance @ 20mA current (closed circuit): maximum 120 Ohm

I don't believe that you need bigger relays in the TS-590S to drive your
Acom 2000A.

From a good friend I heard that the TS-590S suffers power spikes
(overshoot to the full 100 Watt output). This could be a problem with
the 2000A; I am sure it is... Please try and let us know.

It is documented...

KEYINOUT.TXT:

Information about the KEY-IN and KEY-OUT connections.

Both amplifiers ACOM1000 and ACOM2000A are QSK-compatible with all QSK-capable transceivers on the market. The only limitations are the electrical specifications of the signals KEY-IN and KEY-OUT. The keying circuit requirements for the ACOM1000 and the ACOM2000A are identical.

1. The amplifier's T/R-control input for the antenna relay is called "KEY-IN". When in OPERATE mode, on this input appears a DC signal that is to be held low to activate the amplifier to the transmit mode. This can be done via either a relay contact or a semiconductor (transistor or integrated circuit) with suitable polarity (plus to the ground).

NOTE: You should prefer a semiconductor output when it is available on your transceiver, since relay contacts on some models are slow with respect to their RF output. You may see a "Hot-Switching Warning" or "RF detected at wrong time" message otherwise. This message means that an eventual hot switching has been prevented by the amplifier's protection system. You should change to the semiconductor output in such conditions. In addition, utilizing the semiconductor output, you may disable the transceiver's relay clicking (on some models there is a switch intended for a case when the relay is not needed).

The electrical specifications of the amplifier's KEY-IN input are as follows:

- Switching voltage (open circuit) - 15V max, plus to the ground;
- Closed-circuit current - 15mA max;
- Voltage drop / resistance of the control output @ 15mA (closed circuit) - 1.5V/250 Ohm max.

You can control the KEY-IN signal in two different methods. Look at (3) for a second way.

For the preferred mode, you have to connect the KEY-IN socket to the transceiver's output that goes to the ground when you transmit. Practically all transceivers have such an output, and their electrical specifications exceed the amplifier's requirements. Transceivers producers give different names to this output, and they are for instance: TX-GND, SEND, *T/R-LINE, KEY-OUT, etc.

Some transceivers require that their signal "ground on transmit" be implemented via a software command, or by changing of a switch on the rear panel, or interior of the transceiver. Some models generate a "+12V on TX" signal. Then, you may need a simple n-p-n or n-mos transistor, controlled through a 10kOhm resistor to the base or gate, in order to "invert" the available signal in a "GND on TX". Look in your transceiver's manual or contact your dealer or ACOM directly for details about a particular model.

Please use always shielded cables for these connections.

2. The KEY-OUT socket on the rear panel is a "phono" type (RCA) connector. When you don't use the second method of the connection (see p.3), this is an extra output signal from the amplifier, that could be either used or not. When used, it would improve the T/R process of switching and would increase the exploitation reliability.

The KEY-OUT output is usable when the transceiver has available a respective input to disable transmitting when the amplifier may need it. If your transceiver has no such input, or you use the second way of the KEY-IN connection (p.3), please don't worry: the amplifier will be fully protected and will function normally, so the KEY-OUT may remain unused. If your transceiver however possesses a suitable input that is capable to disable transmission, we recommend that you utilize that feature. Just connect this input of the transceiver to the KEY-OUT socket of the amplifier.

Transceiver producers give different names to this input, and they are for instance: TX-INHIBIT, MUTE, LINEAR, KEY-IN, etc. It is available sometimes on BAND-DATA, ACC, EXT, LIN, ATU, and etc rear-panel connectors. Some transceivers may require that a "transmit disable" function is implemented via a software command, or by changing of a switch, or via adding an external pull-up resistor, etc. Look in your transceiver's manual. You have to use the preferred connection of the KEY-IN socket (p.1) to utilize this feature.

The output KEY-OUT of the amplifier is an open-drain circuit and it can hold a positive DC signal to the ground. During all the periods when the amplifier is ready to transmit, this line will always pattern the requests "GND on TX" in order to enable transmission. When transmitting is not permissible, the output becomes open (for instance, while the antenna relay is in process of switching-over) and the transceiver would stop RF driving.

The electrical specifications and timing of the amplifier's KEY-OUT output are as follows:

- Switching voltage (open circuit) - up to +50V,
- Switching current (closed circuit) - up to 20mA,
- Internal resistance @ 20mA (closed circuit) - 120 Ohm max,
- Delay time - 5ms max (2...3ms typically).

While the amplifier is not powered, and in STANDBY mode, this output is directly connected to the KEY-IN socket. Thus, the amplifier will send back the "ground on transmit" signal to the "TX enable"-input of the transceiver always during OFF and STBY modes in order not to disable any transmission.

In OPERATE mode the signal KEY-OUT will pattern the signal "ground on transmit" that is coming on the socket KEY-IN, always when the antenna relay is in safe position and when no other warning is present. The signal KEY-OUT will reject transmitting if the amplifier detects any risk condition.

Besides, the amplifier contains an independent self-protection that looks after the relay safety during a T/R-switching, regardless of taking or not an advantage of the KEY-OUT signal.

3. If your transceiver has not a suitable connector providing an output signal "ground on transmit" nor "+12V on transmit", you can use the second connection method as described below.

Connect the PTT or CW-keying contact to the amplifier's socket KEY-IN on the rear panel. Then connect the amplifier's socket KEY-OUT to the input PTT or CW-KEY of the transceiver. Always use shielded cables for these connections.

CAUTION: Please check up, that the parameters of the signals PTT and CW-key of the transceiver met the specifications of the "KEY-OUT" output of the amplifier (see p.2 above). Some very old transceivers models may require buffering if the requirement is higher than 50V/20mA.

With the second way of connection, the amplifier will just pass the PTT or keying signal directly to the transceiver always when powered off and during STBY mode. During OPERATE, the signal will pattern your PTT/keying after the antenna relay reaches a safe position, and will disable transmission during relay's motion as well as during any risk condition.

The second way of controlling the transmit/receive process could be very useful also if the transceiver has an incorrect timing sequence of its T/R signals. For instance, if the RF power appears before a "ground on transmit" is fed to the amplifier.

Thank you Hans. By the way, it appears that Kenwood is addressing the power spike issue with the latest firmware upgrade. I will try it tonight. Here is the information from the Yahoo group reflector:

This is what Firmware 1.02 fix

Updated items : (Version 1.01 1.02) [January 20, 2011]
Revises the following symptoms.

1. In [SSB-DATA] mode, Speech Processor might not be disabled internally.
2. At the end of TX tune mode, carrier output returns to normal mode level after a short delay.
3. When the TS-590S is turned ON, the USB port connection may be unstable.
4. When the built-in electronic keyer is set to Mode A, CW keying may not work properly.
5. TX rise time power spike activates some linear amplifiers' input power protections.
(The firmware Ver.1.02 revises the ALC response characteristics to reduce the power spike.)
6. When a separate RX ANT is connected, TX output power may be fed back to the RX ANT connector and might affect internal circuits.
(The firmware Ver.1.02 deactivates (opens) RX ANT relay every time the radio transmits.)

Hello Bob,

This is an excellent initiative of Kenwood, because powerspikes are very unpleasant during QSO's. I know this when I used the IC-775DSP which suffered power spikes too.

Enjoy your TS-590S and 2000A!

Hello Hans,

Thanks for the information. The TS590S spec states a maximum of 10mA current is available to switch in Position 1, when the relays are quiet, so I think I must use the

The power spikes do appear to be a problem. They are not enough to cause the amplifier protection to cut in and I saw the same thing on the Acom 1000. I would guess that Kenwood can resolve this problem with a software update. I'll check on the TS590 reflector and see what is said there.

In the meantime, I'll go and measure the actual current on closure of the key-in contacts and see what happens.

Thanks for your help.

I have a friend who also has an Acom 2000A who just told me during our 40 meter roundtable he was sitting with the amp in idle (not transmitting) listening to the conversation of the group when he noticed his PROC red light came on then went to HEATER yellow light and IG1-3.5MA came up on his RCU screen followed by the text, "should be 0.0ma".

The amp will not operate now.

Any ideas what the problem may be?

Those of you running the Icom IC7700 or IC7800
and the ACOM 2000A, what have you selected within the radio
to "key" the amplifier? and why?

There are two options:

1. lead [relay]
2. mosfet [solid state]

Have you noticed any anomalies such as latency, key clicks, bias challenges, RFI etc.?

Please let's not go into ALC VS no ALC or tube amplifiers VS solid state amplifiers etc.

Marty,

I owned the '7700 and '7800 but did not interface them to the ACOM 2000A. So, with that in mind, here are my observation when using these rigs with other amps. I did own an ACOM 2000A, so I am very familiar with its key line circuitry...

First, I would select the MOSFET setting. The MOSFET is rated to handle quite a bit of key line voltage and current. Keying an unmodified SB-220 would be a concern, but not the ACOM with it's logic-level key line. The MOSFET is so robust, I would not use an external amp key line buffer, unless the amp was a vintage type where 120VAC is used.on the key line. Actually, the MOSFET can handle it (the Icom relay option cannot) but I would not take the chance with a vintage amp.

Second, note that the '7700/'7800 do not have an adjustable amp delay parameter in the menu. With some combinations of amps, the '7700 produced audible clicks in the headphone, while the '7800 was much better. Whether a slow or fast amp key line, the '7800 never exhibited headphone clicks. This is primarily a CW QSK phenomenon. If you operate SSB almost exclusively, I wouldn't worry.

The '7700 and '7800 switch so fast (RF in under 9 msec. after the key line goes low), I would not use the ACOM's handshake feature on the key line. The handshake is to compensate for the transceiver, not the amp. Simply put, I would just run an RCA cable from the Icom to the ACOM key line and omit use of the return line.

So, although this does not directly answer your question as the ACOM 2000A operation, hopefully it's still helpful.

Paul, W9AC

Hello Martin,

For 2,5 years I operatered the Icom IC-7700 and the Acom 2000A.

The interconnection is very simple between the rig and the amplifier:

IC-7700: RELAY
2000A: KEY IN

And the coax cable of course ;-)

Nothing more. No external relay, no interface or what ever.

No latency, no keyclicks, no power spikes, no RFI, no bias challenges,
no nothing but good and very reliable operations.

Hi Paul,

you said correctly. I run an IC-7800 and a ACOM 2000A and it works like a charm just by wiring them with the RCA cable (no KEY OUT on the amp side)

3924. ACOM 1000 intermittent fixed

Yahoo group: acom-list (2010 — 2016)
Date: 2011-01-29 22:18:48 UTC
From: n4960m
Topic: 3924 Message: 3924

Fora few years I've had an intermittent failure to transmit with my ACOM 1000. Various e-mails to Stanimir and others suggested reseating the various JP# wire terminals on the boards. Sometimes the case uncovering and wire reseating helped, but only for a limited time...weeks to months between failure. Changing shack layout sometimes provoked a dead amp until stuff was wiggled about.

After the last event I decided to download the Service Appendix A and B, and go look at the wiring schematic and follow it in the amp. Two visible problem areas were noted. The SO239 RF input had what appeared to be a potentially poor solder joint to the board, presumably from periodic movement from the PL259 center pin in the port. The wire from the 239 to the board would wiggle some. I reflowed the wire joint at the 239 and board connection under the tube base. That stiffened up the wire. It probably was not the main fix as the amp would most of the time show RF input from the exciters, but no PO when the problem was happening. But, sometimes even no RF input could be detected on the amp's meter at full power from the exciters so that proceedure probably helped.

Likely the big problem was the female RCA Key In center connection in the amp. The RCA port is soldered to the circuit board, but over the years periodic careless sideways twisting of the cabling between the exciters and amp had spread open the center female connection in the RCA port. It's factory built with a split at the top of the concentric connector, and can eventually get loose enough to not properly contact the inserted center pin of the send cable to the rig.

I took a sharp pointed awl, and with the cover off the amp, AC cord disconnected and HV spots carefully grounded, poked and retightened the split center connection so there was again good contact when the send cable was inserted. Fixed for now.

hello

I have an Acom 2000A for 1 month, it's a very nice amplifier. But since yesterday I HEATER LED of the control box that flashes in CW mode, this afternoon I was in CW on 12m with 25w IN, temperature 34 ° tubes after a few minutes setting it has led Heater flash, so I stopped emissions and the letter continued to flash for 2 minutes. This is the second time this happens. the temperature of the tubes when the LED was flashed at 45 ° you have a solution to the problem.

sorry for my English

73

Arnaud

As the owner of an ACOM, I see this LED lite up with the higher line voltage and not the temperature on the final tubes. Is your input voltage set correctly inside the amplifier when you first purchased the A2000? How many times did your heater LED flash? Joel, K2QBV

Goodnight Joel

Thank you for your reply, the voltage of the amplifier is rated at 240V, I have on my supply line 232V max, this afternoon the voltage of my line was a 224V.

I did not count the blinking LED

Well, lets see what other ACOM 2000 owners suggest. Count the flashes when you see them. My experience has been when the line voltages creeps up to 252 volts. The amplifier is safe up to 258 volts even if set to the highest position... Joel, K2QBV

When it blinks it means that the heater voltage is slightly high. If it were to come on solid, that means it would be slightly low. There is no significance to "blink count".

Topic: 3925 Message: 3931

I have never noticed the Heater LED blinking in CW signals... This must be a new feature.

My Heater LED very often blinks fast, but this is quite normal and nothing to worry about.

Acom writes:

A. Concerning the "HEATER" LED indicator you may need the following information:

If "HEATER" indicator lights continuously, probably mains voltage is lower than the nominal. If it often blinks (twice per second), mains voltage is higher. You may still work safely even when "HEATER" is lit, as this is a warning indication only, but the protection threshold is yet close. If even more severe mains voltage deviation occurs, the auto protection would trip, the red "PROT" LED will flash, and an appropriate text message will be issued on the LCD.

In order to determine how close are the trip conditions, you may enter the MEASURE sub-menu and monitor the following values:

- MAINS (line input voltage, no protection is directly derived);
- FIL-V (filament voltage, 10V to 14.4V is acceptable);
- IF-REAR (filament current - rear tube, 3A to 4.4A is acceptable);
- IF-FRONT (filament current - front tube, 3A to 4.4A is acceptable);

The heater voltage protection would trip at voltages below 10V or over 14.4V, and the corresponding message to the operator is issued on the RCU. Respectively, the thresholds for heater current protection are 3A and 4.4A, and appropriate messages appear when tripped.

For your information, the nominal filament voltage is 12.6V, and the nominal current is 3.6A. The "HEATER" indicator on the RCU is normally dark. It will light constantly if the filament voltage drops below 11.6V, and it will frequently blink if the voltage exceeds 13.6V (in order to inform you that nearly half of the acceptable range is crossed). In both cases the voltage selection may need to be changed if this conditions predominate. See also p.11 below.

B. Mains voltage tolerances.

See S.7-1j on p.29 of the Operating Manual. Normally, a +/-10% excursion of nominal tap voltage is acceptable. For instance, this is 216...264V with 240V nominal. The amplifier would work up to +/-15%.

If you however exceed these thresholds (below 204V or over 276V for 240V nominal), supply voltages and/or currents may reach dangerous values. No

protection is directly associated with the mains voltage, but nearly all supply voltages (and some currents) would reach their protection threshold values, so various amplifier protections would begin tripping, in order not to let any damage in both: power supply, or the tubes.

Anyway, the control circuit is happy even at a voltage drop of-20%, i.e. below 190V, with 240V nominal tap selected. If mains voltage drops still further (below -25%), the control circuit in the RCU immediately switches off the amplifier, and becomes inoperative, until the voltage restores to at least -20% of the nominal, i.e. at least 190V will be needed to start up at the 240V tap selection. This hysteresis is intended to reject unusable ON/OFFs and RCU restarting, if the mains voltage is frequently fluctuating near the lower acceptable limit.

A controllable step-up / step-down tap-transformer (for 20A nominal current) would be a good solution in low mains conditions, not only for the amplifier. You may find also suitable automatic AC voltage regulators on the market.

During Field Days, we use our 10Kw electrical generator. This produces 255VAC volts under NO LOAD conditions, but drops to 218VAC volts at full-load.

This means I see the heater LED flash when we are on standby, but it stops flashing when we transmit or put a kw of lighting on during the evening = lower VAC.

I think this "heater" condition is mentioned in the manual / user guide.

Bob, W5OV, is correct. The blinking LED indicates the Line Voltage is higher than normal but within limits.

The details of the ACOM 2000A protection features related to this LED are as discussed below:

Concerning the "HEATER" LED indicator you may need the following information:

If "HEATER" indicator lights continuously, probably mains voltage is lower than the nominal. If it often blinks (twice per second), mains voltage is higher. You may still work safely even when "HEATER" is lit, as this is a warning indication only, but the protection threshold is yet close. If even more severe mains voltage deviation occurs, the auto protection would trip, the red "PROT" LED will flash, and an appropriate text message will be issued on the LCD.

In order to determine how close are the trip conditions, you may enter the MEASURE sub-menu and monitor the following values:

- MAINS (line input voltage, no protection is directly derived);
- FIL-V (filament voltage, 10V to 14.4V is acceptable);
- IF-REAR (filament current - rear tube, 3A to 4.4A is acceptable);
- IF-FRONT (filament current - front tube, 3A to 4.4A is acceptable);

The heater voltage protection would trip at voltages below 10V or over 14.4V, and the corresponding message to the operator is issued on the RCU. Respectively, the thresholds for heater current protection are 3A and 4.4A, and appropriate messages appear when tripped.

For your information, the nominal filament voltage is 12.6V, and the nominal current is 3.6A. The "HEATER" indicator on the RCU is normally dark. It will light constantly if the filament voltage drops below 11.6V, and it will frequently blink if the voltage exceeds 13.6V (in order to inform you that nearly half of the acceptable range is crossed). In both cases the voltage selection may need to be changed if this conditions predominate.

I hope this helps to explain this feature.

Hello Arnaud,

Same here in our village. We still are in the migration from 220 to 230
Volt. Every year or so our electricity net supplier decreases the Voltage.

You and I can choose between the 220 and 240 Volt tap on the
transformer. Both will do fine.

3936. EBS bias mod --again--

Yahoo group: acom-list (2010 — 2016)
Date: 2011-02-07 03:48:09 UTC
From: kamarty456
Topic: 3936 Message: 3936

I apologize for bothering the gang again about a minor anomaly that
most hams simply ignore, or have no clue about.....

I received some information regarding modifying the EBS circuit to
reduce or eliminate the "bias crunch" that can occur.

I ran into a slight hic-cup....
My amplifier [2000A] has a 1997 REV-4 interface board.
The modification instructions I received was with a much newer
interface board May 2006 REV 5 [I think]

I only have schematics and no circuit board layout views. My Tech manual is also on 3 1/2 floppy's and I asked ACOM for a newer CD version of the tech support manual [so far no response]

The boards are indeed very different as mine is a lot more populated
and dense....The newer board is less populated and even has some solder pads to permit a reasonably easy modification. It would
even allow me to bypass the EBS completely if I desired to do so.

The EBS capacitor is 100nf [0.1 uf] The modification delineates
adding a 220nf [0.22 uf] capacitor to change the bias time constant.

Now, I was hoping a simple solder task of tacking the additional capacitor on some solder pads....

On my board I did find the correct capacitor but I'm not sure if I have the room to piggyback the additional capacitor.

I suppose I can pull the board and surgically add the capacitor or simply change the over the value to a single 330nf [0.32-0.33 uf]
capacitor....

I wonder if anyone one on this reflector has modified their EBS circuit? What did you do? what were the results? What vintage 2000A
amplifier did you do this modification? etc etc

I dropped Will at ACOM a long E-mail around two weeks ago but never had a reply. I also sent an E-mail to the gang at Array Solutions and
their response was not exactly what I expected..They told me they never heard of any EBS modification....

I have not contacted Bulgaria directly yet.

I'd appreciate anyone who has done this EBS change to reply I appreciate the words of support but I'd rather read about results prior to me diving into the amplifier.

I know it's not a major challenge but I'm looking for a user review of how the amp performed after the modification prior to jumping in.

Hello Marty,

This week I intend to do the EBS crunch mod too.

From the beginning I receive some complaints about my modulation.
Station where my signal is very strong (59+20 or more) hear the crunch
in my voice (or better say: during intermissions of my voice).

Last week friday I wrote Acom and I expect their answer today or tomorrow.

I obtained information from several users of the 2000A and I decided to
do the full EBS mod. Not with the extra capacitor, but with the wire.
IMHO the extra capacitance is half a job.

What I have heard from others there is no significant more heat coming
from the linear amplifier due to the full EBS mod. One person did not
install the extra fan and wrote me that he does not observe more heat
coming from the 2000A than before the full mod. This of course also has
to do with the kind of transmissions you make with the linear amplifier;
e.g. mode, operating method, contests, etc.

I ordered the Papst 4412F2/GLL-IBL fan and hope to receive it tomorrow.
As soon as this fan arrives I will do the full EBS mod, make some
photographes of the installation of the extra fan and the wire and
publish it on my internetsite.

To be continued...

Marty,

You're free to discuss it with Acom directly as they would have ultimate authority over such a modification.

As an Acom dealer, we are not free to discuss or recommend that you modify your amp in any way that Acom does not sanction or recommend.

Hans,
Is this problem related to the year in which the 2KA was manufactured, or does it affect all the Acom 2KAs? If it is year related, which dates are affected? What exactly does the EBS mod change in the amp? Thanks.

Two questions:

1. Hans, can you please post "Acom voice distorted.mp3" to the Files section? I am unable to open it within the Word doc.

2. Can we each check whether our own 2000A's display this problem by monitoring in a second receiver while driving the Acom with 5-10W on ssb and checking for distorted audio?

Hans & Marty,

Hans' results show classic EBS distortion. With the change of only the timing cap, it appears EBS will stay active in the final bias state slightly longer, thus minimizing the bias state changes with changes in input power. I would then expect EBS distortion to occur only at the beginning of a spoken sequence. So, with only that cap change, EBS distortion would be minimized, but not eliminated. Complete EBS deactivation requires bypassing of R42. Another option is to simply let a small amount of plate current flow when the PTT line is active. On the Alpha 77Dx/Sx, a trim pot can be adjusted to allow for a small amount of plate current to keep the amp away from a complete cut-off state. This greatly improves switching IMD characteristics.

Referring to the ACOM schematic, note that R41 and R42 form a voltage divider to the emitter of Q4. It may be possible to replace R42 with a 5K-ohm trim pot -- or a combination pot and fixed resistor to limit the trim range. The trim pot would then be adjusted to let a small amount of plate current flow, and yet the EBS still remains active, although the range of its function is reduced. Of course, any such mod should be approved by ACOM and the usual warranty limitations would apply.

It's interesting that ACOM suggests use of an external blower if EBS is bypassed. Since many installations use the table-top RCU with the main amp located some distance from the desk-top, blower noise should not be an issue. This seems like an extraordinary measure and they're treating EBS as if it's a noise gate, which it isn't. EBS is a means of heat reduction and economizing on power consumption, but RF switching devices should never be used as a non-linear noise gate. That function is better suited in AF stages.

Marty, later control boards are just as densely packed as your older version. On newer boards with SMD technology, I suspect many components are not seen from the front, giving the illusion that the component density is not as high.

BTW, what Hans has presented is why the ARRL and other publishers of equipment product reviews should conduct dynamic IMD testing. Two-tone static IMD testing shows what the amp is capable of, not the performance it's delivering.

EBS circuits, exacerbated by ALC loops from transceivers of varying manufacture/design all lead to real-world IMD problems that are not identified in the monthly product reviews. Those of us using high-quality pan adapters know this from experience. Take a look at the passband "shoulders" of strong stations across the band and you will see significant performance differences. I typically look at the are around the carrier set point since it takes the upper passband limit of consideration (e.g., Tx running 2.4 kHz v. 3.5 kHz).

I have seen stations using recently developed transceivers into solid-state amps with narrow audio consuming 10 kHz of bandwidth. By contrast, one ESSB station in California is using a TS-950SDX and Alpha 89 amp. The shoulders drop like a rock down to better than -50dBc. So much for the assertion that ESSB with pronounced low-end audio must produce excessive IMD. True, the occupied bandwidth may be extended but that occupation of bandwidth is from the desired response of the operator and not IMD products.

Thanks guys...
Now this was the technical stuff I was looking for.

My career field was in medical electronics not "RF"
I worked in the hospital environment working on
patient care stuff and laboratory stuff...sort of the
McGyver techy person....you get a phone call at 3 a.m.
you go to the hospital and go into the operating room. The doctor has a guy on the table "opened up" and he gives you a paper clip and rubber band and screams "you have 3 minutes to fix the damn machine or the patient dies!!". [music starts]

The information Hans provided here is pure gold! You all will notice he has presented photos of the newer style and older style interface circuit boards. The "newer" boards have the solder pads while the older board you actually need to jump the resistor R-42.

OK so now I'll go back and open the amp again...then move ahead.

Bob, W5OV...I did not mean any disrespect when I barked about Array solutions not knowing about the EBS anomaly. I realize as a distributor you have certain limitations regarding product support.

By the way I already have the external fan installed....

I'll report back when this is accomplished

> I have seen stations using recently developed transceivers into solid-state amps with narrow audio consuming 10 kHz of bandwidth. By contrast, one ESSB station in California is using a TS-950SDX and Alpha 89 amp. The shoulders drop like a rock down to better than -50dBc. So much for the assertion that ESSB with pronounced low-end audio must produce excessive IMD. True, the occupied bandwidth may be extended but that occupation of bandwidth is from the desired response of the operator and not IMD products.

> Hans & Marty,
>
> Hans' results show classic EBS distortion. With the change of only the timing cap, it appears EBS will stay active in the final bias state slightly longer, thus minimizing the bias state changes with changes in input power. I would then expect EBS distortion to occur only at the beginning of a spoken sequence. So, with only that cap change, EBS distortion would be minimized, but not eliminated. Complete EBS deactivation requires bypassing of R42. Another option is to simply let a small amount of plate current flow when the PTT line is active. On the Alpha 77Dx/Sx, a trim pot can be adjusted to allow for a small amount of plate current to keep the amp away from a complete cut-off state. This greatly improves switching IMD characteristics.
>
> Referring to the ACOM schematic, note that R41 and R42 form a voltage divider to the emitter of Q4. It may be possible to replace R42 with a 5K-ohm trim pot -- or a combination pot and fixed resistor to limit the trim range. The trim pot would then be adjusted to let a small amount of plate current flow, and yet the EBS still remains active, although the range of its function is reduced. Of course, any such mod should be approved by ACOM and the usual warranty limitations would apply.
>
> It's interesting that ACOM suggests use of an external blower if EBS is bypassed. Since many installations use the table-top RCU with the main amp located some distance from the desk-top, blower noise should not be an issue. This seems like an extraordinary measure and they're treating EBS as if it's a noise gate, which it isn't. EBS is a means of heat reduction and economizing on power consumption, but RF switching devices should never be used as a non-linear noise gate. That function is better suited in AF stages.
>
> Marty, later control boards are just as densely packed as your older version. On newer boards with SMD technology, I suspect many components are not seen from the front, giving the illusion that the component density is not as high.

Bob Array Solutions,

What is worrisome is that Array Solutions said they never
heard of the EBS modification!!!

Do you guys fix these amps or just sell them???

If Acom has not "told" us about it, we officially have not "heard" of it.

Make sense?

73,

Bob W5OV

P.S. Ive been on this reflector since it started, so I'm personally aware
of most everything that has been discussed over all of these years.

How many of the 2000A amps are affected by the problem? How can we
duplicate the problem so that we can hear it on a 2nd rx while transmitting?

Thanks & 73,
Barry N1EU

3949. Re: [acom-list] EBS bias mod --again--

Yahoo group: acom-list (2010 — 2016)
Date: 2011-02-07 20:19:19 UTC
From: Hans Remeeus
Topic: 3936 Message: 3949

Hello George and all,

IMHO this is an 'all-version' issue of the Acom 2000A, because all Acom 2000A have the EBS built in.

Acom says that it is only heard within 1 or 2 km. from your station, when you put a very loud signal on-the-air and the frequency is clear. This is what Acom wrote: "ACOM does not recommend introducing this modification unless you have EXTREMELY high sound-quality requirements. The difference can be detected only at very small distances, under 1-2km. Normally you do not need it and all ACOM2000A, ACOM1000, and ACOM1010 units up to date have been produced without such a modification.You should know that although possible, this modification sets a compromise between the temperature regime and the signal quality. The minimum capacitance which satisfies your quality requirements is recommended. Full EBS elimination should be avoided unless you have the additional external fan installed."

In fact Acom says that they have produced their linear amplifiers *without* the EBS modification. Perhaps they will do so now or in the future, when more users got worried...

I noticed that since the beginning operating the Acom 2000A, in August 2004, I receive complaints from my fellow ham stations on 80 meters that they hear the crunch. Actually we call this 'ravel'. It sounds a little bit like RF feedback. And I am not the only Acom 2000A user with the recognizable crunch. So I disagree with Acom that the EBS mod is only meant in case you have *extremely* high sound-quility requirements. I don't have such requirements, but do not want to receive complaints about my audio.

Actually I must tell you that I use a horizontal deltaloop antenna with 6 dBd gain and 89 degrees elevation on 80 meters. Therefore my signal normally is between 59+20 and 59+40 dB in The Netherlands, Belgium and Germany. For this reason many stations will notice my crunch. Not only stations who live very near to me, within a distance of 1-2km, but many others too. When my signal is 59 or less nobody hears the crunch.

When I have done the mod this week I can tell you more about the effect of the mod on my audio and on the temperature regime.

Hello Barry,

The best way to recognize the EBS-crunch is on 80 meters when
HF-conditions are excellent, almost without QSB, the frequency is clear
and your signal is 59+20 dB or stronger.

And use a lot of short speech intermissions (pauses, breaks, intervals;
I don't know how you call this).

I forgot something important to mention; when your processor/compressor
is OFF the EBS-crunch will be more noticable by other stations! This is
easy to explain, because when you have your processor switched on, your
signal will be more compressed; therefore less speech intermissions and
less reason for the EBS to switch the Voltage...

Hello Barry,

1. I would love to, but how? I tried this evening but did not succeed to save the two MP3 files and upload them. Perhaps someone knows how to do this.

2. Good suggestion. I never tried monitoring myself on a second RX. IMHO the scope measurement is the best way.

From: K0DAN
Topic: 3936 Message: 3954

I just tested my Acom 2000A (1998 vintage) into a dummy load and could not discern the raspy distortion which was so evident embedded in Hans' DOC file. I did not use the lab set up Hans did, but just with my ears and an aux receiver I did not notice any distortion at any drive level.

I would be concerned about the distortion problem described, but am loathe to perform mods on equipment which appears to be functioning properly.

That's my $0.02 worth...

Hello Paul,

Excellent remarks and opinion! In fact more than excellent!

This IMD really is a world-wide problem on our HF-bands. For this reason I would strongly suggest the use of a two-tone generator for everyone how uses a linear amplifier and a microphone. I look on my LP-PAN SDR IQ Pan Adapter almost all the time and see a lot of big shoulders and sometimes not only two of them...

Actually I bought a manual operated 1,500 Watt linear amplifier in December 2009. This one was excellent built, very neat, very solid, very heavy and in a very large cabinet. But the IMD (3, 5, 7 and even 9) was terrible! I returned the amp within a couple of weeks. The cheap GS35b triode tube is inappropriate for SSB transmissions and do you know how many stations in Europe use this tube on HF? You better don't want to know...

> BTW, what Hans has presented is why the ARRL and other publishers of equipment product reviews should conduct dynamic IMD testing. Two-tone static IMD testing shows what the amp is capable of, not the performance it's delivering.
>
> EBS circuits, exacerbated by ALC loops from transceivers of varying manufacture/design all lead to real-world IMD problems that are not identified in the monthly product reviews. Those of us using high-quality pan adapters know this from experience. Take a look at the passband "shoulders" of strong stations across the band and you will see significant performance differences. I typically look at the are around the carrier set point since it takes the upper passband limit of consideration (e.g., Tx running 2.4 kHz v. 3.5 kHz).
>
> I have seen stations using recently developed transceivers into solid-state amps with narrow audio consuming 10 kHz of bandwidth. By contrast, one ESSB station in California is using a TS-950SDX and Alpha 89 amp. The shoulders drop like a rock down to better than -50dBc. So much for the assertion that ESSB with pronounced low-end audio must produce excessive IMD. True, the occupied bandwidth may be extended but that occupation of bandwidth is from the desired response of the operator and not IMD products.

Hans,

Larry, N8LP will soon be offering an affordable Tx spectrum analyzer with built-in 2-tone generator. I suspect that even without the 2-tone test, it will be able to display reasonable dynamic IMD information to capture EBS and ALC effects.

http://www.telepostinc.com/LP-500.html

An analyzer specific for job has been long overdue. I'm happy to see that it's Larry making the device. He truly understands RF mechanics.

Paul, W9AC

Hi All As a new member to this group I'am not up with play.Does this EBS also affect the Acom 1000 .Thanks Morrie

Hello George and all,

IMHO this is an 'all-version' issue of the Acom 2000A, because all Acom 2000A have the EBS built in.

Acom says that it is only heard within 1 or 2 km. from your station, when you put a very loud signal on-the-air and the frequency is clear. This is what Acom wrote: "ACOM does not recommend introducing this modification unless you have EXTREMELY high sound-quality requirements. The difference can be detected only at very small distances, under 1-2km. Normally you do not need it and all ACOM2000A, ACOM1000, and ACOM1010 units up to date have been produced without such a modification.

I spent some time trying to elicit the type of tx distortion as in Hans' report but was unsuccessful. I duplicated his two test tones and monitored the rx spectrum as I slowly increased drive upwards from 1W. I saw no non-linear behavior. I did see an increase in IMD as output power increased, but nothing nearly as ugly as Hans reported.

This afternoon I did the deed!
I placed a jumper across R42 on the interface circuit board,
or as some call it "a zero ohm resistor".

I was very lucky as I did not have to remove the interface board to accomplish the modification.

Hans, I compared your schematic diagram that you published here in your excellent file to my schematic....
There are definitely a lot of differences between a 1997/1999 vintage
board and a 2006 board.

For example:

R42 on my board is 1kohm, on the newer board it's 3.9kohm.

The potentiometer for bias adjustments Rp2 on my board is 220kohm,
on the newer board is 50kohm

There is a resistor R137 1megohm on the newer board the older one does not have that part.

R51 on my board is 47kohm, on the newer board it's 22kohm at 1 watt

Q9 on my board is IRF630, on the newer board it's IRF710

etc.etc.etc.

I suspect many changes are due to parts availability and also minor circuit upgrades/changes.

regarding the EBS crunch..It is GONE!!!!
Lovely quiet! I use a Marantz PMD661 digital recorder and use the SPDIF output of the IC770 into the digital input of the recorder. I route the output via the mixer and the analog signal is directed to ACC-1 mod-line input.
Often the EBS crunch was very obvious during playbacks..tonight
SILENCE ...

Regarding increased temperature; it's too soon to determine what the overall effect will be. I do have the optional fan installed.

I do notice a slight temperature increase of maybe 20c [68f]. Keep in mind I only operate SSB fidelity audio. I typically try to keep each transmission under around 1 minute, 2 minutes if I get too long winded.
I have never exceeded 90c [194f] and the amp cools down quickly to around 70-75c [158-167f].

The tube is still well within its temperature parameters as the amp will go into a temperature overheat alarm..at about 150c [302f]. The

tube parameter shows maximum operating temperature is 200c [392f].
ACOM has done an excellent job regarding keeping the tube at a stable and wide operating temperature range.

Regarding IMD products, a friend using his elecraft K-3 pan-adapter looked at my signal very closely. He was very critical and told me I was pure and clean...I utilize the entire 3khz my radio can present and I drop off precipitously and no spikes or crud what so ever. I compliment both the Acom 2000A and the Icom IC7700 for that result.

Thanks to all of your help and to those participating in this topic.

Hello Marty,

Congratulations with your efforts and the results of it. Again a more
than satisfied user of the Acom 2000A with a clean signal; this is the
way to go!

As soon as I have received the extra fan I will do the job myself and
publish the photographs and text on my internetsite.

Please keep us informed about the temperature. Do some extended
transmissions on the dummyload and watch the temp of both tubes on the RCU.

Enjoy your clean voice!

3969. Tube Temperature

Yahoo group: acom-list (2010 — 2016)
Date: 2011-02-08 14:40:29 UTC
From: Hal Kennedy
Topic: 3969 Message: 3969

A recurrent error on this board has come up again in the recent postings concerning disabling EBS. The exit air temperature as measured by the amplifier is not the same as the tube envelope temperature. They can't be, per Newton's law of cooling.

A few things to think about:

- The 4CX800A and GU74b are rated for an absolute maximum envelope temperature of 200 centigrade.
- No components, including tubes, should ever be operated at their absolute maximum ratings. They should be run near their typical operating characteristics.
- The DIFFERENCE (gradient) in temperature between the tube envelope and its cooling air increases as power dissipation goes up - the function is linear in the region we are interested in. (Fourier's law)

So, as a hypothetical example, an exit air temperature of 90 centigrade might mean the envelope of the tube is 150 centigrade. The gradient is 60C. But if the exit air climbs to 100C, the envelop might climb to 165C for a temperature gradient of 65C. In this example, the envelope reaches 195C for an exit air temperature of 120C for a temperature gradient of 75C. (To keep this easy I have ignored the other important gradient - delta T between the input air and the output air)

What are the real, rather than the hypothetical numbers? We would need to put a thermocouple on the hottest spot on the tube and make some measurements to know. When Alpha designed the Alpha 91b RF deck, that wound up in the 2000A, they no doubt made these measurements. My hypothetical above will not be far off however.
Bottom line:

My view of the engineering in the Alpha 91b/ACOM 2000A is it is outstanding - but by that I mean it has just what it needs and not much more in every characteristic. Adding additional margins costs money amateurs are usually unwilling to pay for. This extends to the cooling. It's adequate at up to an input air temperature of around 35C at 5000 feet altitude (Denver, CO) for ICAS service. It also appears to be just adequate at steady state (10 minutes of key down) for 25C input air at sea level. Beyond that the auxiliary fan is suggested.

I won't comment on the additional heat introduced by, or the wisdom associated with, disabling EBS. Just don't assume all is well if the exit air is below 200C - far from it. Amateurs always want to push the envelope - pun intended.

73,
Hal N4GG

To add to Hal's excellent explanation of the temperature INSIDE the tube is not what one measures at the OUTSIDE of the tube I would like to add the following:
Also the measured temperature differs when on different locations (above or aside the tubes in example) are used to measure the tubes temperature. When measuring the temperature at two different locations, the values easily differ 10-20 degrees Celcius when compared to another in an Acom 2000A.

Just my two cents.

Thank you Kees.

I have an external temperature gauge with its thermistor placed above the rear tube exhaust. comparing the RCU temperature indication and the external gauge I typically see about a 20 degree variance. It does not matter if I place the thermistor at the front tube as the readings are about the same.

Now to be fair I do wonder how accurate the RCU values are..as I had to recalibrate the mains voltage indication..it was off by almost 5VAC!

I use the external temperature gauge to read Fahrenheit.

I noticed a slight temperature increase of about 20c [68f] during my normal operating. I will report back later this evening to share all my RCU parameters when the amp has been operating for over an hour.

My tubes are just shy of 3900 run hours.
I do have the external cooling fan.

3972. RE: [acom-list] New file uploaded to acom-list

Yahoo group: acom-list (2010 — 2016)
Date: 2011-02-08 23:22:19 UTC
From: bmarton
Topic: 318 Message: 3972

Hi Hans,

I click on the link enclosed in the e mail, I am brought to a log in page in yahoo groups, then I get a dark grey page with a start key and a progress bar for the file, but nothing more. It will not start, it cannot be started by clicking on anything and it just sits there. Any ideas as to why the file will not load or play?

Bruce K1XR

Hello Bruce,

I just monitored the file and this is the whole recording. The file ends with my callsign (in Dutch).

Bruce, I would first go to:

http://groups.yahoo.com/group/acom-list/files/EBS%20and%20Bias%20crunch%20mod/

And then you should see 10 files that Hans has posted and you should be able
to right click any of them and save them to your disk.

I'm wondering why not implement the jumper with a SPST relay to remotely switch it in for ragchewing and switch it out for contesting - that way you could keep the amp cooler during those 48-hour marathons.

Barry,

I did go to this page, saved the file to my desktop and it opens with media player and plays all of a split second of audio, that's all I get! Is this a quicktime file by any chance? If so, that might be my problem as I don't have it on this computer.

No Bruce, it's a standard mp3 audio file (128kbps, stereo, 48kHz sampled,
48sec) that plays in my Windows Media Player. Check that the file you save
is 758KB in size to confirm you really got it.

Evening Barry,
I wish the band was a bit better to hear you 5/9+20
Using a small switch to engage or disengage the EBS is doable

Just remember to the majority of hams EBS is a moot topic as well as EBS on other brands of amplifiers.

So..it's up to you and your station as to what you'll do regarding the EBS circuit.

I'll be posting parameters later.

3979. Parameters after EBS is bypassed

Yahoo group: acom-list (2010 — 2016)
Date: 2011-02-09 02:45:06 UTC
From: kamarty456
Topic: 3979 Message: 3979

I'll try to present this with some sort of logic so please bear with me.

First a few comments:

I only really noticed an increase in the exhaust air temperature,
I estimate about 20c or 68f.
All other parameters were just about as they were prior to the modification. The bias function now only has two modes on and off.

Oh, the most obvious result was the elimination of the "bias crunch"

bias stby= -127 oper= -57 [transmitting and does not fluctuate between words]
VSWR = --- = 1.0
Temp-R= 51-53c = 77-87c
Temp-F= 51-53c = 77-87c

At this point let me comment about temperature as it varies significantly. I only use SSB fidelity audio. Key down time
runs from typically 45 seconds to a long winded 2 minutes..I try to avoid long diatribes.

When the amp is first turned on after the initial warm up I typically see 40-45c. After I transmit say 1 minute the temperature is around 75-78c and then when I wait for my turn again the amp cools down
quickly to 55-67c. This depends upon when my next turn happens.

Worse case I briefly saw 90C and a cool down to 77c. I never exceeded 90c. The amp high temperature alarms/faults at 150c so I'm not concerned.

When I shut down, I always allow the amp to cool to 50-53c before turning the RCU off and amp main switch off.

Remember at 80c the amp will still run when you shut off the RCU to cool the tubes. The high temperature alarm protection is at 150c.

The optional fan kicks in at around 90C. The fan if tied to its associated circuit control is actually a two speed arrangement.
It runs "on" continuously, at 90c it increases its speed to facilitate a quicker cool down.

Back to parameters:

screen V stby= 12 oper= 350-352
rfl-P= ---- 0
plate-RF= 0 1.92
mains= 247 247
I-screen= 0 3ma
I-plate= 0 0.9
I-grid= 0 1.5
IF-rear= 3.7 3.7

IF-front= 3.9 3.9
HV= 2.7kv 2.6-2.41kv
gain= 0 14db
fil-V= 13.3 13.3-13.4
freq= 0 14.178mhz
drive= 0 45-48v
dc input 0 2.19kw

Now your parameters will be different so look at mine only as
a brief snapshot. They do change as I operate. Also these numbers are with the amplifier set to an output of about 1kw

My outboard metering via a Palstar AT-Auto tuner peak reading watt meter. I keyed down using RTTY for the above readings as SSB voice will cause the values to vacillate. The Palstar shows 1kw the RCU shows 1.2kw. I did this into my Sommer XP707 antenna and not a dummy load as it was simply more convenient.

My external temperature monitor set to Fahrenheit and typically reads about 20 degrees lower..I take into account the location of the Acom
temperature thermistors VS my external probe. The difference between
placement in the front or rear exhaust chimney is negligible.

So....in summary ....

If you are an operator that is aware of the bias crunch and is willing to disregard a slight increase of tube temperature then I say
go for it.
If you typically chase DX and contest and do narrow SSB with all knobs to the right, then the bias crunch is really not an issue for you and leave the amplifier alone.

Most hams listening 300-2500 will most often be unaware of the bias crunch. Open your transmit audio to 100-3k or wider and then it will be noticed.

Run the speech processor [over driven] perhaps the crunch is not your main challenge rather IMD and distortion and room noise should be your concern instead.

I personally believe the introduction of the EBS circuit was to allow the manufacturer an easy way to reduce the need for expensive circuits etc. and to keep the retail price of the product low ensuring a longer tube life without concern of signal purity as long as it made the FCC happy in its certification. [my opinion]

I am glad I made the modification. If my parameters are quite different than what you typically see keep in mind the following;
1. my 2000A is almost ten years old
2. I have the original tubes
3. approximate tube hours is close to 3900
4. I do not run the amp to max 1500w I usually stay between 800-1200w
5. I only operate SSB no RTTY or digital etc.

My radio is the Icom IC7700, antenna Sommer XP707, Behringer audio

I'll keep an eye on my parameters and next week I'll revisit the numbers and post them.

I have only run the amp for about 2 hours since making the modification.

Regards,

Marty KA7GKN

The ACOM 1000 would indeed appear to have the same circuit. The equivalent of R42 (ACOM2000) to be short-circuited is R11 on the MAINS PCB.

Hi Uffe,

Thanks for your info. To summaries, the only and only that needs to be done is shorting this resistor in an Acom 1000?

How about a mod for the Acom 1010? Anyone?

Vy 73, de Kees.

Subject: [acom-list] Re: EBS bias mod - ACOM 1000

The ACOM 1000 would indeed appear to have the same circuit. The equivalent of R42 (ACOM2000) to be short-circuited is R11 on the MAINS PCB.

The EBS issue is independent of distance and its effects are most noticeable when receive signal strength is very strong. I typically hear (and see with an SDR-IQ) EBS distortion when signal levels exceed about 20dB/S9.

EBS effects seem most noticeable when the EBS circuit forces the amp into deep Class C during unkeyed idling periods. Even with a fast EBS circuit, the tube still require some time to come out of Class C. Tom, W8JI beautifully sums up the potential EBS "crunch." In particular, look at his paragraph under "Poor Bias Systems."

http://www.w8ji.com/electronic_bias.htm

As he states, these amps would be better placed at the cusp of Class B rather than driven deep into Class C during idle periods. In my opinion, this should be accomplished by the operator to optimize bias as tube characteristics change, replacements, etc. But, most of today's appliance operators do not understand amp bias class. Giving them access to a bias control could be dangerous for the rest of us. However, my understanding is that through a PC terminal connection, the Alpha 8410 allows just that.

To Marty, thanks for the detailed feedback. Your observation almost completely mirrors what I see with my Alpha 77Dx when it's EBS is bypassed with an internal control pot (the functional equivalent of the R42 bypass in the ACOM). The added increase in temperature only occurs when the key line is active and resumes back to normal temps when the mic is unkeyed. This is still far below the heat produced by ops running digital/FSK modes with EBS activated.

In fact, this is no different than what occurs with my SBE solid-state amp. When the key line is active about 1 amp of FET PA current is observed and that does produce some heat. The SBE uses no EBS circuit. The heat increase is masked by the amount generated when producing power.

To Barry's point, I think bypass of EBS in the ACOM 2000A is arguably more important during a contest when signals are strong and the band is densely packed.

The ACOM EBS switches between two idle plate currents (375mA / 55mA for ACOM2000). Both of these currents would be class AB. None of them would be class C.

That said any abrupt change of operating point will introduce non-linear distortion. The problem is not so much the value of the current, but the change of it.

Uffe,

But the system uses three level of bias, not two. The larger problem occurs when using VOX and going from full cut-off to level two very quickly. Your point is excellent in that any abrupt change in bias will introduce non-linear distortion.

After and during PTT the EBS of my Acom 2000A has three (3) bias levels:
- 72V
- 64V
- 51V

Without PTT it is -122V.

I think you mean two levels of bias AFTER the amp is keyed :-)

In the ACOM 2000A, three-state bias is used. -124V on standby, -75V during plate idling, and -52V when input RF is sensed. When using VOX, the amp is quickly transitioning from Class C to Class AB.

-124V at level 1 should represent Class C. I'll stand corrected if it's not.

Hans,

My 2000A was from April, 1999 (purchased through Pekka at FinFet) and it had those three bias states. I had to repair the bias switch, so I became comfortable with the bias operation.

So, perhaps it changed at some point in production? That may explain why some ops are experiencing better or worse EBS effects, depending on the vintage of the amp.

Paul, W9AC

Hello Paul,

You have another EBS circuit than in my 2000A ;-) Mine if from 2004.

Do you really miss the -64V step on your RCU?

Hello Paul,

Yes, probably that's the reason why my EBS does produce more distortion.

When my signal is strong on 80 meters (and most of the time it is)
stations in our country clearly hear a 3-stage crunch, not 2.

Hello Paul and group,

Very interesting page of Tom W8JI! Tom has a very wide and detailed technical knowledge.

Today one of the other ragchewers on 80m wrote me this:
"The rectified RF voltage from your Acom 2000A must beabove the switching point of the Schmitt trigger IC U1B (a 4093B)/. This probably is a few Volts, corresponding with a number of Watts output. That's why we can hearthe crunch on your signal.
Moreover, they arethe same requirements/demands as apply to a good AVC system in a receiver "fast attack slow decay". In the schematics nothing is found on this. The time constant of C43/R40 is not particularlyfast attack and gets even worse by increasing C43! Therefore I think that disabling the EBS in the Acom 2000A is the best option.".

Tomorrow I hope to start with the mod and the installation of the extra fan.

> The EBS issue is independent of distance and its effects are most noticeable when receive signal strength is very strong. I typically hear (and see with an SDR-IQ) EBS distortion when signal levels exceed about 20dB/S9.
>
> EBS effects seem most noticeable when the EBS circuit forces the amp into deep Class C during unkeyed idling periods. Even with a fast EBS circuit, the tube still require some time to come out of Class C. Tom, W8JI beautifully sums up the potential EBS "crunch." In particular, look at his paragraph under "Poor Bias Systems."
>
> http://www.w8ji.com/electronic_bias.htm
>
> As he states, these amps would be better placed at the cusp of Class B rather than driven deep into Class C during idle periods. In my opinion, this should be accomplished by the operator to optimize bias as tube characteristics change, replacements, etc. But, most of today's appliance operators do not understand amp bias class. Giving them access to a bias control could be dangerous for the rest of us. However, my understanding is that through a PC terminal connection, the Alpha 8410 allows just that.
>
> To Marty, thanks for the detailed feedback. Your observation almost completely mirrors

what I see with my Alpha 77Dx when it's EBS is bypassed with an internal control pot (the functional equivalent of the R42 bypass in the ACOM). The added increase in temperature only occurs when the key line is active and resumes back to normal temps when the mic is unkeyed. This is still far below the heat produced by ops running digital/FSK modes with EBS activated.
>
> In fact, this is no different than what occurs with my SBE solid-state amp. When the key line is active about 1 amp of FET PA current is observed and that does produce some heat. The SBE uses no EBS circuit. The heat increase is masked by the amount generated when producing power.
>
> To Barry's point, I think bypass of EBS in the ACOM 2000A is arguably more important during a contest when signals are strong and the band is densely packed.

That audio sounds like overly aggresive noise gating or downward expansion, definitely clipping the intial syllables, and I wouldn't be happy with it either

Today I made the modification of the EBS. This was quite simple and
effective.

Installation of the low noise 12 Volt extra fan took more time.

I will publish the photo's with text as soon as possible and let the
group know.

Tomorrow morning my ragchew group will make some new recordings.

12 V??
In my 1000 it is 24 V.
I have put an old Papst in it. Took me a while to find one for allmost all PC fans are 12 V.
Now looking for a temp. sensor to let the fan be quiet at low temperatures.
And again this has to be a 24 V type, which I did not find yet.

Temperature controlled DC for the fan is available in the Acom - read
EXTFAN.doc in the Group Files section.

The ACOM 1000 has something similar. Use the orange terminals shown on this photo:

http://www.xs4all.nl/~wesselva/acom/acom_switching.jpg

I do not exactly know how the DC varies with temperature. It might just be keyed ON at a specific temperature.

Uffe (and others)

If you read my mail then you should know that I allready have a Fan installed.
And if you read it carefuly you even notice that I use 24 V DC.

The only thing I said that I wondered about the 12V for the Fan, where Hans is talking about.

And I am looking for a temperature controller as the 24 V is allways 24 V in the 1000.

The voltage on the orange terminals is temperature controlled.

Hans,

the 2000A has a small circuit board on the rear of the amp by the back panel near a small grommet to allow the fan wires access to the inside.

The board supplies 24v and also is set to run the fan on "low speed"
all the time and then when the temperature hits 90c the fan speed is increased. If you place the amp away from the station using the supplied
RCU cable length I think 3 meters the amp is still VERY VERY quiet
and fan noise has never been a challenge.

Oh, be sure the air blows into the amp and not outward.

I suggest you simply purchase a 24v external fan either aftermarket or from ACOM.

4007. 2000A software version

Yahoo group: acom-list (2010 — 2016)

From: kamarty456
Topic: 3600 Message: 4007

My amplifier which was put into operation in September of 2001 has Version 4.5.

You can view what version your amp has by selecting the run hours display. On the top row it will display the software version.

Newer amps indicate Version 5.0 or something else

Anyone know what the differences are? Or if you can easily upgrade
to the newer version? Or is it not really necessary?

Are you sure?
When I measured it at start up it showed 24V DC.....

The +24V is wired to 24V, but the -24V is keyed by the signal "fanhi", so it should kick in at 90C.

If you measure with a voltmeter, you might not notice the keying.

I base this on the ACOM 1000 service manual. I have not used an external fan myself.

Hello Marty,

Many thanks for your very kind advise!

In the meantime I succesfully installed the 12V fan.

My main target was trying to find a fan which is *as silent as possible*. 12 or 24 Volt was not an issue because of the jumper on the 'air sensor' board.

I did find a very silent fan with only 16 dB(A) sound and 60m3/h airflow. It is the 12 Volt Papst 4412 F2/GLLL IBL (IBL means ichbinleise (= German)) together with four 'Noiseblocker nb-slics' vibration absorbers. It was not very expensive; all together about 25 Euro.

This morning I did some tests with the ragchew group on 80 meters and they all told me that my audio is *significantly* improved after the full EBS-modification.

The extra fan is extremely silent. When I lay my ear on the filter I can hear something, but this is a negligible sound.

I am as happy as you were a few days ago!

Photos say more than a thousand words and I will publish them as soon as possible.

73,
Hans Remeeus (PA1HR)
http://www.remeeus.eu

Uffe and others

I have contacted Acom about this matter and here is what they say:

Orange connector labeled 24 V is only for connection of ext fan
The temperature controller is only to control the internal blower
The speed of external fan cannot be controlled.

Best regards,

Maya Georgieva
Export Manager
ACOM Ltd.

So I was right in the first place.

Others,

Concerning the Acom 1000 the schematic shows resistor R61 on sheet 4 of 5 of the MAINS which is 47 ohms 2 watts. This resistor is in series with the external fan which means the external fan will be running all the time at slow speed until the air temperature reaches 90 deg. C at which point resistor R61 will get shunted out by action of the EXTFAN- signal. This will increase the speed of the external fan. Same action as that of the main fan. If one takes a Volt meter across the EXTFAN terminals of JP8 with no fan attached you will read 24 Volts.

Hello Martin
I am sorry to disagree with you.
At least in my Acom 1000 with the serial number 100158 this is not the case. I asked Acom about it and this is the reply:

Orange connector labeled 24 V is only for connection of ext fan
The temperature controller is only to control the internal blower
The speed of external fan cannot be controlled.

Best regards,

Maya Georgieva
Export Manager
ACOM Ltd.

It is okay to disagree Hi. I am hoping that the schematic information that Acom is releasing is correct. Perhaps it would be wise for us all to confirm the presence of R61, it's value and some of the signal paths associated with this issue. The schematic clearly shows on sheet 4 of 7 of the CONTROL board the same signal, FANHI, controlling both the speed of the main and aux. fan. The main fan has an additional control line, FANON, to turn on through again a 47 ohm 2W resistor R44. This resistor also gets shunted out by FANHI to apply full power to the main fan.

Are there different versions of the schematic covering a particular series of serial numbers ? The serial number of my Acom 1000 is 090282 which would appear to be a later model but this assumes sequential numbering.

Can someone from Acom verify the accuracy of the Acom 1000 schematics that they have released ? Are they correct or not in this case ?

- Martin

Hi All My Acom 1000 was purchased in July 2004 and apart from a choke in the grid going open shortly after purchase, has operated satisfactorily apart from the 18mhz band requiring very little plate capacitance.(Is there a known cure for this?)
I think at this time in it's life it would be good insurance to have a schematic on hand in case of problems.Is there somewhere a schematic can be downloaded on the internet?
If you only have one hacksaw blade it will surely break but with a spare you will wear it out.Thanks Morrie

Morrie,

I just uploaded the Acom 1000_Sch.pdf file to the Files section. Not sure what to say about the 18 MHz issue you have except on my amplifier the Tune capacitor is near maximum 90 and Load is 75 which seems normal.

I see ~90 (Tune) and ~65 (Load) and this seems normal to me as well.

Evening Hans...

I'd be very interested to see how your 2000Ac temperatures changed after the modification.

I have been on air now three days and although I may hit 90c at times,
the amplifier cools down quickly and I'm not going to over react.

I do need to verify my external fan is blowing INTO the amp
I think I installed it correctly, but I will still verify it.

Thanks again for your excellent EBS file.

Hello Marty,

This weekend (12:00z-12:00z) I will participate in the 24-hours
PACC-contest, so this is a very good test!

Monday I will let you know and hope to send you the link to all the
photo's of the EBS-modification and installation of the optional fan.

Nice weekend!

Topic: 4022 Message: 4022

Hello Group,

This morning I saved the file of the recording after the EBS mod.

People who know my signal and audio on 80 meters all tell me that my audio is *significantly* improved after I made the EBS-modification. The difference is big!

You can hear it yourself:

audio/ PA1HR after the EBS mod 15-feb-2011
<http://f1.grp.yahoofs.com/v1/EJJbTZ76cgigGi0tMAtqKR6keY5Zhb67SrOeKuzS5wc_HAbOEzTy5UyhPxDPwhlOdGJuzV-sm__bqzCTIL0uIdX7sQ/EBS%20and%20Bias%20crunch%20mod/PA1HR%20after%20EBS%20mod%20%2015-feb-2011>

PA1HR after the EBS mod 15-feb-2011 EBS and Bias crunch after the modification. First part of the recording is without the processor and the second half of the recording is with processor switched on. You will hear a significant difference between the recording before and after the EBS mod! Recording is made with Flex5000 SDR on February 15th 2011. My exciter is the Yaesu FTdx5000d in Class A.

audio/ PA1HR before the EBS mod 08-feb-2011
<http://f1.grp.yahoofs.com/v1/EJJbTVEOXAegGi0t1pA0ZMQPjwwNpTExboqTPYu-81jnEbwHOBUO5GN2olNCH3EaCUBq5DNIydHr8zQe9nKNx4hFjQ/EBS%20and%20Bias%20crunch%20mod/PA1HR%20before%20the%20EBS%20mod%2008-feb-2011>

EBS and Bias crunch before the modification. First part of the recording is without the processor and the second half of the recording is with processor switched on. You will hear a significant difference. Without the processor the Bias Crunch is very good readable. With processor the Bias crunch is still there, but not so significant. Recording is made with Flex5000 SDR on February 8th 2011. My exciter is the Yaesu FTdx5000d in Class A.

I published the photo's and text on my internetsite:
*http://tinyurl.com/6h2q7ak
Please note that this is a *temporarily* link and should not be saved/bookmarked for later purposes.
As soon as I have the final link I will inform the group about it.

Subject: [acom-list] Recording before and after the EBS mod

Hello Group,

This morning I saved the file of the recording after the EBS mod.

People who know my signal and audio on 80 meters all tell me that my audio is *significantly* improved after I made the EBS-modification. The difference is big!

You can hear it yourself:

audio/ PA1HR after the EBS mod 15-feb-2011
<http://f1.grp.yahoofs.com/v1/EJJbTZ76cgigGi0tMAtqKR6keY5Zhb67SrOeKuzS5wc_HAbOEzTy5UyhPxDPwhlOdGJuzV-sm__bqzCTIL0uIdX7sQ/EBS%20and%20Bias%20crunch%20mod/PA1HR%20after%20EBS%20mod%20%2015-feb-2011>

PA1HR after the EBS mod 15-feb-2011 EBS and Bias crunch after the modification. First part of the recording is without the processor and the second half of the recording is with processor switched on. You will hear a significant difference between the recording before and after the EBS mod! Recording is made with Flex5000 SDR on February 15th 2011. My exciter is the Yaesu FTdx5000d in Class A.

audio/ PA1HR before the EBS mod 08-feb-2011
<http://f1.grp.yahoofs.com/v1/EJJbTVEOXAegGi0t1pA0ZMQPjwwNpTExboqTPYu-81jnEbwHOBUO5GN2olNCH3EaCUBq5DNIydHr8zQe9nKNx4hFjQ/EBS%20and%20Bias%20crunch%20mod/PA1HR%20before%20the%20EBS%20mod%2008-feb-2011>

EBS and Bias crunch before the modification. First part of the recording is without the processor and the second half of the recording is with processor switched on. You will hear a significant difference. Without the processor the Bias Crunch is very good readable. With processor the Bias crunch is still there, but not so significant. Recording is made with Flex5000 SDR on February 8th 2011. My exciter is the Yaesu FTdx5000d in Class A.

I publised the photo's and text on my internetsite:
*http://tinyurl.com/6h2q7ak
Please note that this is a *temporarily* link and should not be
saved/bookmarked for later purposes.
As soon as I have the final link I will inform the group about it.

You should check the setup in your PC...
Link works OK here on 4 different PC's
in the house...
First of all: log in to the group and go to
the files section. Then click on the file there.
If still nothing check that you have a mp3 compatible
media player and plugin in the PC. Windows media
player, winamp, and most if not all players are compatible.
Try to reinstall the player if still nothing.
If running Linux same thing applies.
The audio difference before and after ebs mod is amazing !!
This mod is a MUST for the audiophile. For me it is completely
a waste of time. My hobby is communication, not hi-fi :-)
But that is me. Others may find this mod VERY useful !
But it puts a heavier load on the tubes AND other circuits in the amp.
Doing this to a PA still under warranty may be expensive !!
Peter

Hello Peter,

Today I uploaded measurements on the 2000A before and after the EBS mod.
So you can see what is the influence of the mod on the working
conditions of the linear.

IMHO the differences in the load of the amplifier are not as much as we
would expect. The same opinion I hear a from ham-friend in Germany who
made the mod more than two years ago.

I don't believe that operators will push PTT for a couple of minutes or
more, without saying something in the microphone. In terms of load the
only difference of the mod is *between* moments of voice transmissions
while pushing PTT. When you use VOX operation there will be a
negligibledifference, depending on the settings of the VOX (such as
delay etc.).

Hello Hans !
What you say appears to be correct as long as we only consider
SSB/voice . However, my amp is also used extensively for CW.
In CW the picture is completely different. Without the mod the amp
will "rest" between "dits and daahs" IF the designer applied the correct time constants....
and I think he did....
WITH the mod the amp will draw full bias current all the time unless you want
to kill your expensive output vacuum relay running QSK all the time......
1 million cycles is a number easily reached in a surprisingly short time running
QSK.
Try to draw a correctly timed "time lapse" picture of a typical CW transmission
and then calculate the excess power (heat) generated in % because of this mod !
My conclusion : At 1500 watts CW out these tubes are already pushed quite hard.
The "4CX800 " type number stated by Svetlana is not correct. It should have been
4CX600 -- if anything.... but really it has nothing to do with Eimacs patented
3X and 4X series tubes. The production spread is also dramatic...meaning that
specs and quality varies a lot between production batches.
IF you are going to use this amp for CW and you want to mod it you need to either:
A : Be able to switch this mod out and in
or
B : Stay below 1 KW out.
This is my opinion at least.
I have installed the aux fan in my 2000,- it still gets pretty hot after 48 hours of CW
contesting.
Without the mod...
But,- as i said earlier the difference is remarkable in high quality SSB (ESSB).
BUT it comes at a price...
While I am at it : The Acom 2000A can be pushed to nearly 2400 watts PEP or CW
with fresh tubes, good line regulation and correct settings.
DO NOT DO IT !!! Stay at MAX 1500w ! Exceeding this will dramatically shorten the tube life
!
Running 2KW out may reduce tube life 70 %. And despite the fact that
tubes are still easily obtainable, they are expensive if you want well matched and
preconditioned tubes. I have tried several "NOS" sources and what I got was
a lot of junk. Somebody makes easy money out there :-)
I have a total of 6 "superb" NOS tubes around here...completely out of specs.
I then tried Vine antennas in the UK... and got fine tubes,- at last.
The Acom 2000A is a very well designed and engineered 1500w amp with some headroom...
But as a 2KW out amp it has some shortcomings...
My license is only valid for 1000W out, so for me this is a premium amp :-)
Peter

For those of you concerned about running other modes that would
appreciate the EBS circuit like CW etc.

It is not written in stone that you can only have the EBS one way or
another..Simply add a SPST [single pole single throw] toggle switch
Use a shielded cable and route it to the rear of the amp or simply drill a small hole in
the front panel and install it.

Then you can select EBS on/off as you desire.

Remember, when I started this discussion I specifically indicated I
only run fidelity SSB!!! I do not run and digital modes!

So don't get upset with me or Hans' excellent technical information to help others who want
to disable the EBS system.

Also the parameter information is unit specific! You amplifier will have different values!
Close maybe, but still different so don't get
all bent out of shape and start screaming!

For example Hans' 2000A shows 15.5db of gain my amplifier shows 14-14.5db of gain.
My mains voltage is 245-247 his are 225-231
Use the parameters as a guide to determine the condition of your amplifier. His parameters
and my parameters are both well within the specifications of the ACOM 2000A.

I am not bent out of shape and screaming :-)
I appreciated the mod info and I stated
also that the difference in fidelity is amazing.
Please do not see my comments as an attack !
It was not intended that way. I was just discussing
this from a technical point of view. It is sometimes
useful to consider all sides - also possibly negative
ones. The solution is as you say to install a switch.
Or as I said (direct copy) :
A : Be able to switch this mod out and in
or
B : Stay below 1 KW out.

So...we agree ! :-)
Cheers !
Peter

Hi Peter,
I was not looking at you. you have added to the discussion.

Be aware there are many folks out there that should not be allowed to use tools! I will bet as more folks become aware of the EBS circuit
pros and cons, leave alone or disable, someone is going to make an error or abuse the amplifier and return here screaming that it's our fault he damaged his amplifier!

Keep in mind modifying anything inside the 2000A or any other ACOM
product immediately voids their warranty!!!!
Remember in the early discussion Bob at Array Solutions indicated this is not an authorized modification by ACOM and they will not support it either.

In fact the majority of other amplifier manufacturers do not encourage the modification of their EBS type circuits.

I won't parrot the early information but again warn those who are not competent to avoid doing this modification. 90% of most hams and those that simply contest, DX, and run lots of speech processing and run 300-3500 bandwidth won't have a clue that the bias crunch is there. They will assume it's QRM or band noise! Those only running digital modes don't need to worry about the EBS circuit.

Perhaps I'm living a charmed life. The Jennings RF1 vacuum relay in my Alpha 70V is now 41 years old and has been QSK-switched most of its life. I think the 1 million operation parameter is very conservative for a vacuum relay, provided it is not hot-switched. By contrast, some of the newer sealed frame relays are rated for 10 million + operations. Nice, but I'll still take the vacuum relay for RF switching.

The ACOM 2000A uses an RJ1 (or equivalent) vacuum relay and the amp also includes excellent protection circuitry from hot-switching. Me, I would let the amp switch in QSK and not worry about relay replacement. Sure, there will be instances where the relay will fail, but without knowing the exact failure mode, it may have failed anyway with -- or without extensive QSK switching.

Hello Peter,

Last weekend (after the EBS mod) I participated the 24-hours PACC contest, with 1,400 QSO's. Not full, but about half QSK. I did not notice more heat than I had before the EBS mod. Regularly I felt the airflow coming from both the tubes, but again no more heat that during other contests. The maximum measured temperature of both the tubes was 64 degrees C.

IMHO there is no extensive heat at all, after the EBS mod. After last weekend I am completely convinced and reassured :-) :-)

I considered a SPST at the rear panel of the linear amplifier to toggle the EBS on/off. I would do this when I only got the feeling that there is more heat, but (so far) there is none.

For 100% I agree with you that we should *never* push the Acom 2000A in any way. Not with special settings of the transformer, not with the exciter drive power, not with anything. Actually I would never ever exceed 1,500 Watt output power. You must know that in our country "only" 400 Watt output is allowed, so we have a very clear limit through our regulations. For me the choice for the Acom 2000A is particularly based on the A of Automatic. During contests this excellent and lightingfast feature (together with the antennas) is of much more value than a few hundred Watts more output power.

So keeping the output power below 1,000 Watt with peaks of 1,500 Watt is an excellent advise! Nobody will notice the last few dB, only the amplifier will...

You are living a charmed life :-)
The Jennings RJ1A is rated at a mechanical
life of 2 million switch cycles by the manufacturer...
as is Gigavac GH1 and Jennings RF1 .
Well,- I admit 2 is more than one...but still....
It depends on how active you are . Here we run
many 48 hour contests every season...so for us
at LA8W / LN8W this is an important consideration.

Thanks for the info on this Hans !
I really expected more heat--especially in CW.
As Marty pointed out this mod should not be attempted
by someone without good skills in electronics...
You have that,- but others reading this may not have.
The control board with the EBS is, at least in my amp,
behind the front panel... it is very crowded and there is
a large number of static sensitive components on it.
The processor board is directly connected to it and mounted
in a shielded enclosure behind the control board. It is easy
to destroy processor components working with the control board.
I blew up the EPROM by accidentally shorting two points on the
control board. They were less than 1/32 inch apart...
Acom Bulgaria provided me with a new one in a few days...but anybody
attempting this mod should have excellent eyesight and calm hands :-)
I did not do this mod at that time, I had other problems. One of those
"superb NOS tubes" I mentioned before had an internal short between
G1 and G2. Murphy had a lucky day and before the protections got
time to react I lost 3 transistors in the G2 supply / stabilizer and 2 on the
control board. In later versions of the amp the series regulator mosfet
in the G2 stab is upgraded to a higher voltage type. This should
protect against this failure mode. If this mosfet fails the G2 voltage soars
to a high value. Getting this straight into the EBS is not a good thing :-)
Peter

Thanks very much Hans!

I had one question about the fan voltage configuration. Your text says:

"Where the yellow cross is signed on the photo above you have to scratch
away the PCB-print with a little sharp knife."

Does that mean your amp came from the factory supplying 24V DC to the FAN
+/- terminals? If a 24V fan was used, it wouldn't have been necessary to
open the cover under the tube deck?

Thanks & 73,
Barry N1EU

Hello Barry,

You are correct.

If the individual setting of your Acom 2000A is 24VDC and if you use a
24V fan, there is no need to open the cover and scratch the print away.

Please have a look in the Operating Manual of your Acom 2000A on Page 6,
Table 2-1 ACOM2000A Individual Data.

When here is written "Optional Fan Output Voltage 24VDC" and you want
(or have) to use a 12V fan, than you have to do the same as I did. I had
to do this, because we don't have a wide choice of silent 24V fans here.

Does anybody know which make/model of fan Acom supplies if you buy the
external fan from them? Or what cfm rating they provide/specify?

Looking at 24vdc 119mm fans, it's a tradeoff between cfm and noise - I'd
like to keep it quiet yet still provide adequate additional air flow.

Thanks & 73,
Barry N1EU

From: AB2E Darrell
Topic: 4048 Message: 4048

Hi group,
I recently picked up the switching network for the acom 2000a. I have it working fine in manual mode.
I haven't really had time to set it up for autoswitching. Does anyone have any tips for this?
I just downloaded and installed the Acom tools program, but havn't launched it yet.
I have the serial cable connected between the amp and the switch, and the box set on Amp, but it does not change the switch when I change bands on the amp.
Your suggestions welcome,
73 Darrell AB2E

Darrell,

The software has nothing to do with the switch operation, so forget that.

The instructions of how to do this are in the manuals that come with the switch and the controller. Do you have them?

You can download them here:

http://www.acom-bg.com/images/stories/A2000S/manual/oper_man_eng_2000s.pdf

http://www.acom-bg.com/images/stories/A2000SW/manual/oper_man_eng_2000sw.pdf

The Bulgarian to English leaves a little bit to be desired, but I think that you should be able to figure it out.

It's been a while since I set one up, but basically, you have to manually select the antenna you want as you change the amp to the various bands by QSYing with your radio as per normal. The amp/controller work together to "remember" which antenna you last chose for that band. QSY to 40, manually select the 40m antenna, QSY to 20, manually select the 20m antenna. QSY back to 40 and it should "remember" what antenna it used on 40 and so on.

If you manually change antennas from what was programmed - say if you have two 40m antennas, it will remember the new antenna you selected on that band - and will forget about the old selection.

Build your own, this way you don't need to buy a gender bender as most cable are male - female.

Just 3 wires to solder, use some cat 5 cable and buy two female DB-9 connectors that you can solder to.
That's what I did and it works great.

I thought there was a diagram on the reflector forum that shows the pin outs.

I had a pin out diagram but cannot find it now.

A simple null modem cable is

Pin 2 - Pin 3

Pin 3 - Pin 2

Pin 5 - Pin 5

Although if you want to make use of the remote on capability (with an interface between the RCU and ACOM2000a) you will need more connections.

4054. Final temperautre observations after EBS modification

Yahoo group: acom-list (2010 — 2016)
Date: 2011-02-26 02:20:00 UTC
From: kamarty456
Topic: 4054 Message: 4054

It's been about two weeks since I did the EBS disable modification.
I only operate fidelity audio SSB.

Many of you during the EBS disable discussion were concerned about the tubes exhaust air temperature changes etc.

I won't repeat the parameters but instead let me assure you
I have not experienced any temperature faults what so ever.

A snap shot is the best I can do as the air temperature obviously
changes constantly. I was running about 1200 watts to the antenna

After the 3 minute warm up cycle the RCU reports:
front=39c
rear=39c

After the first transmission about 1 minute +/-:
front=61c
rear=67c

After about a two minute cool down before next transmission:
I participate in a round table and large group.
front=55c
rear=57c

After second long transmission about 2 minutes +/-:
front= 73c
rear=81c

After about 1 minute cool down before next transmission:
front=53c
rear=53c

So..... the average temperature when transmitting is from
about 61c to a maximum of 85c [I think I hit 90c one time].
The cool down temperature between transmissions can
vary from 53c to 61c depending upon how long the time is between
transmissions.

When I'm done for the day, I allow the amplifier run in stand-by
for a while until the temperature is around 50c-53c. then I turn
the amplifier RCU off.

I probably run very conservatively so your temperature values
will differ. The age of the tubes, and other variables will also effect your temperature values.

My purpose here is to simply reassure those of you that the
amplifier is very well made and the elimination of the EBS circuit effects it minimally.

Now..those of you doing RTTY, CW, digital modes, long key downs,
my readings will not have any meaning to you.
Those of you that simply have fidelity SSB conversations the
EBS crunch disabled will have minimal effect.

I do though suggest you do add the external muffin fan.
I suggest the 24vdc model and wire it into the existing circuity
in the amplifier...That way it will speed up and blow more air into the box at 90c, and provide a faster cool down.

I do not know what the CFM of the external muffin fan is in
low or high speed. I would also like to know that as well as
what is the CFM of the internal blower? If anyone has this information please post it.

Oh, I had some critical observations of my transmitted signal both audible and on a scope. These were observed using a K-3 and its pan-adapter and an Icom IC7800. The results indicated I have
no IMD products what so ever from disabling the EBS circuit,
and my audio is smooth and rich without any "crunch"

Another way to describe the bias crunch is to crumple up a sheet of paper. That sound emulates the bias crunch.

I'm on 14.178 mhz Monday through Friday at 2300utc if you desire to hear my signal. I run an Icom IC7700, Behringer audio, Samson CO2 microphone, Marantz PMD661 digital recorder, and a Sommer XP707
log type beam at 70 feet. 10 elements on a 20 foot boom or
4 active elements on 20 meters.

I guess my amplified Astatic D-104 with the
audio setting on my PRO3 all cranked up to be as
aggressive as possible (while still remaining
legal) wouldn't add much to fidelity audio SSB
testing? I'm a DXer, and I only go on SSB if I can't find'em on CW.

I've never seen the temperature above 80°C
even with prolonged CW rag-chews (4-5 minutes
transmitting at 23-25 WPM at full power) from my
ACOM-1000, but this is really mixing apples and
oranges. Do you think the average power (and
hence exhaust heat) would be higher with a
prolonged CW transmission than with a prolonged
SSB transmission? I would guess SSB probably has
an average higher power than CW, but I've never really measured it.

Hello Marty,

This looks very fine!

Same here with the temperature after the EBS. I too have not experienced
any significant increase of the temperature, no faults, no problems.
Just very good audio reports from all who know my voice and signal.

The way how you describe the bias crunch is very well choosen; like
crumpling up a sheet of paper. That's how it sounded before the EBS
modification. When you breath during voice intermissions and still have
PTT activated. Very annoying for those how listen to your signal when
it's loud and strong.

I am very happy I did the EBS modification.

Next modification I will do on the Acom 2000A is the replacement of the
two SO-239 by N-connectors. This will be tougher to do than the EBS-mod.

Hello Paul,

IMHO CW and SSB are about the same, in terms of average power and exhaust heat. Depending on the way you are using CW and SSB, there will be no significant differences. Both modes do not demand a 100% duty cycle.

Fidelity SSB is an oxymoron. But nice to dream about achieving the impossible.
Besides you need ears on the other end with good fidelity realize the benefits. That's getting pretty rare..

I think this discussion is mostly about IMD products. These generally fall outside the listener passband. You can have low IMD but terrible fidelity.

Lower IMD is a worthwhile goal even if one can't achieve true fidelity. However even an amp/exciter combo with -40 db IMD products (if your S9+10) is still going to clobber an S3 adjacent channel signal. The more cost efficient means of helping this situation is to reduce power. This of course doesn't happen much in practice.

Most likely an S2 signal with "fidelity" will not get through as often as Paul's combo where the power is (hopefully) concentrated where the listener can best hear it.

Thanks to Hans and Marty for their efforts in providing mod info.

Don't mean to beat a dead horse, but I'd still like to know how I can hear the "problem" by monitoring/recording my amplified xmsn (either voice or tones) in a second receiver. I tried some two tone tests and couldn't see any non-linearities in the received spectrum as I slowly increased drive from zero.

Thanks & 73,
Barry N1EU

Marty,

I think the key phrase in your message is this: " I only operate fidelity audio SSB".

Is it fair to say that for those of us who do not do "fidelity audio SSB", this modification would not yield any benefits?

Thanks,

Bob W5OV

Subject: [acom-list] Final temperautre observations after EBS modification

It's been about two weeks since I did the EBS disable modification.
I only operate fidelity audio SSB.

Many of you during the EBS disable discussion were concerned about the tubes exhaust air temperature changes etc.

I won't repeat the parameters but instead let me assure you
I have not experienced any temperature faults what so ever.

A snap shot is the best I can do as the air temperature obviously changes constantly. I was running about 1200 watts to the antenna

After the 3 minute warm up cycle the RCU reports:
front=39c
rear=39c

After the first transmission about 1 minute +/-:
front=61c
rear=67c

After about a two minute cool down before next transmission:
I participate in a round table and large group.
front=55c
rear=57c

After second long transmission about 2 minutes +/-:
front= 73c
rear=81c

After about 1 minute cool down before next transmission:
front=53c
rear=53c

So..... the average temperature when transmitting is from
about 61c to a maximum of 85c [I think I hit 90c one time].
The cool down temperature between transmissions can
vary from 53c to 61c depending upon how long the time is between
transmissions.

When I'm done for the day, I allow the amplifier run in stand-by
for a while until the temperature is around 50c-53c. then I turn
the amplifier RCU off.

I probably run very conservatively so your temperature values
will differ. The age of the tubes, and other variables will also effect your
temperature values.

My purpose here is to simply reassure those of you that the
amplifier is very well made and the elimination of the EBS circuit effects
it minimally.

Now..those of you doing RTTY, CW, digital modes, long key downs,
my readings will not have any meaning to you.
Those of you that simply have fidelity SSB conversations the
EBS crunch disabled will have minimal effect.

I do though suggest you do add the external muffin fan.
I suggest the 24vdc model and wire it into the existing circuity
in the amplifier...That way it will speed up and blow more air into the box
at 90c, and provide a faster cool down.

I do not know what the CFM of the external muffin fan is in
low or high speed. I would also like to know that as well as
what is the CFM of the internal blower? If anyone has this information
please post it.

Oh, I had some critical observations of my transmitted signal both audible
and on a scope. These were observed using a K-3 and its pan-adapter and an
Icom IC7800. The results indicated I have
no IMD products what so ever from disabling the EBS circuit,
and my audio is smooth and rich without any "crunch"

Another way to describe the bias crunch is to crumple up a sheet of paper.
That sound emulates the bias crunch.

I'm on 14.178 mhz Monday through Friday at 2300utc if you desire to hear my
signal. I run an Icom IC7700, Behringer audio, Samson CO2 microphone,
Marantz PMD661 digital recorder, and a Sommer XP707
log type beam at 70 feet. 10 elements on a 20 foot boom or
4 active elements on 20 meters.

Hello Barry,

I don't think that you will hear the EBS-crunch with a transmitted two-tone.

The best way to monitor (or better: record) your own voice with a second receiver is when you make very short voice transmissions and watch carefully the RCU on 'BIAS' measurement.
Look at the display of your RCU and watch the EBS switching between -121V, -71V, -61V and -51V. When you see all four (or at least three) the values on the display, every time you make a short voice transmission, then you will hear the EBS-crunch in the best way. Repeat short voice transmissions for several times and watch the RCU, while you are making a recording of yourself. I would recommend using the dummyload while making the transmissions ;-) Don't make the voice intermissions to long either. E.g. Every 5 seconds at least 2 short voice transmissions saying 'A' or something. Repeat this for about 30 seconds and let the second receive make a recording.

Re: Duty cycle

From the ARRL Extra Class Manual under the RF exposure section:
DUTY CYCLE
SSB - 25-40% with 40% for a heavily processed signal
CW 40%
CONTINUOUS (sic RTTY) 100%

The above figures do not include non transmitting time. That might
reduce the above by 50% or more.

I think it is pretty clear that those interested in "FIDELITY" do not
heavily process their signals. Thus any temperature conclusions about
temperature for "fidelity SSB" don't apply to CW or RTTY.

I don't think this is from the ARRL Extra Class Manual.
Because I do not think that the ARRL will call RTTY a sic mode....

Then check this out if you don't believe me:
http://books.google.com/books?id=EcbjKvhgPLsC&pg=SA11-PA5&lpg=SA11-PA5&dq=%22duty+cycle%22+%2B+%22SSB%22&source=bl&ots=0H2KR-wZJp&sig=EuIh-1w3ioZFqckDcm-oSIG0VlQ&hl=en&ei=dPtoTZWjJ8X0tgeGlITnAg&sa=X&oi=book_result&ct=result&resnum=4&sqi=2&ved=0CCsQ6AEwAw#v=onepage&q=%22duty%20cycle%22%20%2B%20%22SSB%22&f=false

I will admit the sic RTTY was my parenthetical addition. If it suits you
more the table shows AFSK SSB being 100% duty cycle.

No need to check for you admitted it came from you.

I don't understand why you call it sick.
I myself don't like sstv but I don't call it a sick mode.

Subject closed.

No need to check for you admitted it came from you.

I don't understand why you call it sick.
I myself don't like sstv but I don't call it a sick mode.

Subject closed.

this modification would not yield any benefits?"

No, the IMD byproducts generated as a result of the EBS circuit remain the same.

That's correct. EBS and IMD have nothing to do with each other.

The IMD of the Acom 2000A BTW is superb! We measured -45dB IMD3, with
the FTdx5000d as exciter in Class A. Without Class A the IMD3 is -40dB,
which is still very good.

There are linear amplifiers who do -25dB IMD3 and even worse and over a
wide spectrum. Such must be prohibited..

Perhaps I'm not understanding when this phenomena presents itself. From what I've read, it seems that this only occurs at certain intermediate power levels or as you transition through a certain threshold of power output.

Is that incorrect?

Well then, when does this rear it's ugly head, and why, for the last 14 years of Acom 2000A production has no one had any issues or complaints until these "fidelity" guys got interested? I've never had anyone tell me that I have any problem with my audio while using a 2000A whether it was with a TS850, FT1000MP, IC781, IC756ProIII, TS480S or with an Elecraft K3.

Hasn't Acom designed the amp to take a "middle of the road" approach to this issue and avoided the potential overheating - given the minimal impact?

Does this have any influence on CW operating at all? What about non-"fidelity" SSB operation with compression etc. as most normal DX or contest types are interested in today?

In other words, what's the big deal?

4070. Re: [acom-list] Final temperautre observations after EBS modification

Yahoo group: acom-list (2010 — 2016)
Date: 2011-02-26 19:57:23 UTC
From: Hans Remeeus
Topic: 4054 Message: 4070

Hello Bob,

For 6,5 years I own the Acom 2000A and from the beginning I got complaints about the crunch in my audio, but only from my ragchew friends who live near to me. Not from every station, for the simple reason that others only hear the crunch when your signal is *loud and strong*.

3,5 years ago we moved to another part of our country where I was able to install a 400 feet deltaloop. My signal is much stronger now, so I received more complaints about the crunch.

In June 2009 I met a German ham Clemens in Friedrichshafen who told me about the crunch. He got the same complaints and asked Acom for a solution. Acom sent it to him and Clemens did the modification. Clemens is not a member of our group here and Acom kept the EBS-mod silent.

Yes, perhaps it had been better to do the mod years ago, but I thought it was too difficult to do and with certain risks. However the more I did read and hear about the crunch I got more and better informed about the mod and more and more convinced that it was good to do the mod, so I did.

The difference is significant! I am not a fidelity ham, my processor is on all the time, but I always try to improve my station.

If I knew 6,5 years ago what I know now, I had done the EBS-modification many years ago...
If I knew 30 years ago what I know now, I had no mortgage on my house...

IMHO the EBS-mod is important for all who do SSB (no-fidelity too), it is not at all difficult to do the mod (you can find this on my site) and so far (after a few thousand QSO's during contests and heavy tests) we have not found any increase of the temperature or other problems. IMHO the mod is safe to do!

When you only do CW or digital modes you won't need to implement the EBS-mod.

The EBS-crunch and -mod have very little to do with power levels and power output. The EBS works on all power levels.

That's it...

Bob,

The reason for the switching non-linearity from an EBS circuit is that circuit causes the amplifier to quickly switch class of service with changes in input level. That's by design -- to keep the amp biased more toward Class B or C when idle (less heat and better energy conservation), then come out of the class into a Class AB region with the presence of an input signal.

http://www.w8ji.com/electronic_bias.htm

The transitions between class of service cause the "crunching" artifact, especially when the Rx signal level is strong. The byproducts may be in the area of -25 to say -30dBc, which requires a reasonably strong received signal to detect by ear or on a high quality panadapter.

Marty's transmissions look incredibly good now. I believe he's using an Icom '7700 into his ACOM amp. Last week, I observed the shoulders of the passband falling like a rock to better than -40 dBc, and may have been even better had his signal into north Florida been better at the time I was monitoring. By contrast, I routinely see stations with shoulders in the -25 dBc area as a result of various improper drive, EBS, and other non-linear problems.

Like most newer Alpha amps, the ACOM 2000A is capable of extremely good linearity. We know this through 2-tone testing. But 2-tone testing does not manifest the presence of the EBS non-linearities. It's unfortunate that many ops are assuming their amps are being neighborly based upon 2-tone product reviews. But the product reviews do not take into account dynamic IMD testing. And at the end of the day, that's what it's all about in the real world, on the air. The validity of 2-tone testing in an EBS-enabled amp is only relevant for steady-state input testing and only shows what the amplifier is capable of, not how it's really performing because other factors (EBS and ALC, for example)) are getting in the way when we speak into a microphone. 2-tone testing for EBS-enabled amps is a wholly irrelevant metric for SSB transmissions since an otherwise good IMD figure is in reality masked by those other factors.

My amp failed this morning with "IG1=3.8MA: Should Be Zero"

I'm waiting to hear back from Acom, but I suspect the bias control transistor or perhaps one of the final tubes. In the meantime, does anyone have the troubleshooting instructions they received from Acom for this message?

Thanks & 73,
Barry N1EU

Note that for the Acom 1000 the contents of the ACOM1000 CD are schematics and PWB layouts are for the original design dated year 2000. It appears that the "Mains" and "Input A" PWB's were revised in 2001, The "Input" and "Control" PWB's were revised in 2002. Schematically I see only differences in the AC power up circuitry for the Mains PWB. The document I uploaded recently in the files section, Acom1000_Sch.pdf shows the newer revised PWB layouts and schematic differences I have noted in the Mains circuitry.

My friend had the same reading on his RCU and when he got it back the bill indicated a electrolytic took out two fets ....cost slightly above $500.
Tubes were ok.

I had absolutely no problem getting excellent support from Acom Bulgaria
when my Acom 2000A crashed. I got very detailed instructions and parts came
at a VERY reasonable price ! My emails were answered the next day.
That was a different problem involving G2 stabilizer and control card among
other things. The repair was by no means easy,- this amp requires good servicing
skills and measuring equipment. It is up working very nicely since my repair.
I do not know Acom in USA,- Acom Bulgaria is excellent !

Yes, I tried changing tubes and made no difference. I just don't understand
why a cap and two transistors should be $500. If Acom won't support
troubleshooting/repairing by the owner, I would sell my amp.

4079. Please share troubleshooting tips from Acom

Yahoo group: acom-list (2010 — 2016)
Date: 2011-03-03 16:23:44 UTC
From: N1EU
Topic: 4079 Message: 4079

If you've ever received troubleshooting instructions from Stan LZ1IU at Acom, please upload the instructions along with a description of your amp's symptoms at that time to the groups Files section at http://groups.yahoo.com/group/acom-list/files/ or alternatelty email them to me and I'll upload them. If you upload them, please title the document or folder with the Acom error message text.

Those troubleshooting instructions are gems of information that will form a valuable knowledgebase that we should collect and preserve going forward.

I don't know whether Stan is still handling support at Acom. In the past he expertly handled every email I sent but I'm concerned that my recent problems were not handled by Stan. Luckily, I emailed Jaime EA6NB who posted a similar problem 9 years ago and he still had the files on his computer and was able to send me Stan's instructions - I've uploaded them to the Files section. Please, let's collect and share this information now.

Hello Barry,

Very good idea!

Perhaps it is a good suggestion to start a new directory within the filesdirectory for this, with description 'Troubleshooting instructions from Acom Bulgarya'.

I have some e-mails which I can upload.

4085. ACOM2000 RS232 Port

Yahoo group: acom-list (2010 — 2016)
Date: 2011-03-04 15:27:43 UTC
From: James Thresher
Topic: 4085 Message: 4085

I'm hoping that someone can help, I have been doing some research recently into the RS-232 Port on the back of the ACOM2000. As most are aware this isn't really an RS-232 port and only Pins 2,3 & 5 are used for data communications. Looking at the schematics pins 7 & 8 are labelled ON-OUTPUT and ON-INPUT and appear to be tied to the power on circuitry that is normally activated from the On/Off button on the RCU. This seems to imply that the amplifier can be powered on using pins on the RS-232 port without the need to intercept lines from the RCU port, however after trying many different configurations I can't seem to get this to have any effect.

Can anyone here shed any more light on the purpose of these pins? They also have an AUX-INPUT (Pin 6), AUX-OUTPUT (Pin 4) & FANHI (Pin 1)

Thanks

James

M0YOM

Hi Marty,

I replaced bias transistor Q9 (easy job based on info from Jaime EA6NB) and all is well now.

I'd like to once again encourage folks to upload troubleshooting tips to http://groups.yahoo.com/group/acom-list/files/Troubleshooting%20Instructions%20%20/ - the likelihood is that each of us will eventually need help one day. The effort that Stan put into the instructions he sent us should be shared.

4088. 2000A Low G1 Bias failure

Yahoo group: acom-list (2010 — 2016)
Date: 2011-03-16 20:54:41 UTC
From: Sam Leslie - W4PK
Topic: 4088 Message: 4088

Hello all. I have a very early 2000A ser no 137 that started exhibiting the following problem:

When I switch to operate, everything is okay until I apply drive. The power output level briefly peaks up to where it had been (1.4KW) before the problem, but immediately generates a fault saying my bias is too low (-34VDC) and switches to standby.

Thinking that my tubes have finally failed, I switched out the two tubes with two new ones which I had specifically purchased for this eventuality.

After I let the tubes burn in for a few hours, I went through the idling current setup procedure (STANDBY-SERVICE-PLATE CURRENT: Ma, GRID BIAS: V).

It immediately went into a hard fault with plate current in excess of 800ma and shut the amplifier off.

I then turned the two pots RP1 (375ma) and RP2 (50ma) controlling plate idling current CCW to zero. With these two pots set to ZERO, I get the following readings:

First 15-second period:

Plate current varying between 450-550mA (target 375ma)

Grid bias varying between -46 to -52 V

Second 15-second period:

Plate current of 0 (as it should be)

Grid bias of -110V

Third 15-second period:

Plate current varying around 200-280mA (target 50ma)

Grid bias varying between -65 to -78V

These readings were all rapidly varying but I think I got the range okay.

The screen voltage reads 10V in standby and 332V when in operate mode (but with no drive applied). The grid current is zero in standby mode and 1 to 2 mA in operate mode (again with no drive applied). The plate current also reads zero under these conditions.

I have not tried applying drive under these conditions as obviously I have a failure that was not corrected with changing out the tubes.

Does anyone have an idea of what failed? Any help or suggestions will be greatly appreciated!

73, Sam W4PK

4089. 2000A Low G1 Bias failure

Yahoo group: acom-list (2010 — 2016)
Date: 2011-03-18 14:07:49 UTC
From: Jay Terleski
Topic: 4088 Message: 4089

Sam,
I sent your request for help to ACOM in Bulgaria.
Here is their response:

-110 V for BIAS is low, it should be between -120 -130 V. This voltage can be measured on
JP3:1 board interface and with only mains switch turned on. It is possible that capacitor
C2-47mF/200 V on board LV has dried up. It is necessary for test to connect a capacitor
47mF/200 V between JP3:1 board interface (see photo); (-) must be on JP3:1 and (+) on GND.
It is good to check for good working order all elements participating in making up this voltage,
See LOW VOLTAGE SUPPLY Sht.1 of 4.

If all elements mentioned above are OK and the tubes are in good working order then you have to
Check the elements of the circuit for regulation if the initial plate current of the tubes. See
INTERFACE Sht. 4 of 9.

From: Sam Leslie - W4PK
Topic: 4088 Message: 4090

Hello Jay, I checked the -130V bias voltage with a scope and by golly it had almost 40V ripple on it! So I am 99% sure that is what has caused my problem.

I did not have a 47uF 200V capacitor on hand so I have ordered some as well as some 1000 uF capacitors since the LV board is not easy to get to.

Again, many thanks to you and the factory for pointing me in the right direction.

Hi All,

I have a similar problem as Raymond GM0VRP, getting PN27 all the time when going into warming up mode. The HV block seems to be ok - I can measure the 2800Vs for 1s, when switching on. Also the HV voltage detection seems to be ok....1.76V on hvmi-pin. What else can I search for?

73 Mike

Hi All
Thanks for the emails.
The CAPACITOR, ELECTROLYTIC, 25V, 3300UF on the main board was the source of the problem and has now been replaced.

Are you saying that the heater lite starts to flash before the timer waiting period is over?? Please confirm for if that's true I may be able to make a suggestion and explain it to you.

Hi Joel and thanks for reply
I turn on the amp and when I push ON in the remote control unit (RCU)
all leds go to top scale an after two (2) seconds count appear: "HEATERS
ON BEFORE TIMEOUT STARTED" and go down, it do not run.

4105. Electronic Bias Update

Yahoo group: acom-list (2010 — 2016)
Date: 2011-04-03 18:43:15 UTC
From: kamarty456
Topic: 4105 Message: 4105

Back around January 12, 2011 this topic was visited with a lot of
quality discussion.

February 7, 2011 I did the deed and bypassed the EBS circuit in my ten year old Acom 2000A.

It is now April 3, 2011 and not a single problem!
The anticipated temperature increase is well within
the Acom and tube parameters. No fault alarms have occurred.

Remember, I only use SSB, so for those of you hitting the 2000A
hard in digital modes you may want to install a switch, which
was discussed to allow you to turn on or off the EBS circuit.

Remember, for many of you this is an unnecessary modification.
If you typically run say, 250-2500 bandwidth on SSB and listen narrower, then the bias
crunch will likely never be a challenge.
For those of you running wider bandwidths and outboard audio
processing, and/or external recording equipment, I encourage you
to look into the EBS bypass modification.

Thanks to many of you who provided technical and non-technical
discussions regarding the EBS circuit.

Martin KA7GKN

Hello Marty,

Thanks for the good news!

It's the same over here; not one single problem with heat or anything
else. Most of the time I run about 2800 Hz bandwidth during ragchewing
within our country. No more complaints about the crunchy modulation any
more.

Thanks too and all the best!

From: Craig
Topic: 4110 Message: 4110

Gents nice site thanks for setting it up. I have a Acom 2000 question

At the moment I have only one 20m mono band antenna .

i have usr settings tuned at 14.025 14.150 14.250 14.325

the manual states i can store 10 tuning setting per segment ?
does this mean i could store more accurate tune values? I.E in the first segment of 20m band could i store at 14.000 14.010 14.020 14.030 14.040 14.050 14.060 14.070 14.080 14.090 ?

or am I barking up the wrong tree and this is refering to 10 different antennas per segment ?

thanks in Advance

Craig

Now that Array Solutions is well trenched with Acom, what is the protocol for service?

In the past I'd contact Krassy or will, tell them my needs and if
required I'd ship them the amplifier. Are they still supporting the product or has Array Solutions picked up the service end for the USA
Acom amplifiers?

I have no problem with either group servicing my amplifier..however...
the goal is to never let it break!

My 2000A is ten years old and is very reliable

The 10 memory slots per band are intended to store tuning parameters for up to 10 different antennas. You could certainly use them as you describe, but after the amp automatically selects the segment you would have to use the RCU to manually select the "antenna" that matches the sub-segment in which you will transmit.

That said, unless you have an extremely narrow-band 20m antenna, fine-tuning the match is unecessary and will buy you nothing for your trouble. All commercial antennas made for amateur use that I'm aware of are broad enough to provide an acceptable match across 150 KHZ on 20m when the amp is using the same tuning parameters.

I suppose if your 20m antenna is homebrew, is mounted too low or is being detuned by another antenna or structure, it's conceivable that the SWR at resonance is high and/or the bandwidth is uncharacteristically narrow, and an approach like you suggest could be a work-around. But an antenna like that probably isn't going to work all that well, even if you can optimize the match to the amp.

Well just answered my own question, I should have read before posting.

On Array's webpage:

Factory US Service and Support is done by Array Solutions right here in our RF Lab. We are certified by the ACOM factory to perform all repairs to the component level. And we have pretty much all of the spare components that are necessary for the most difficult repairs, not that we have many repairs on these amps. The reliability of the ACOM amplifiers are well known and especially the ACOM 2000A which has been proven over the last 20 + years.

I sure do love my 2000A, I'm spoiled.

Hi Dick ,

thank you for the reply,

thats cleared that up for me , yes and your right it would not be a good antenna , i wasn't sure how the manual was puting it but it is clear now thank you very much OM.

my swr is 1.1:1 at 1400 and rises to about 1.7:1 at 14.350,

tks

I am a new owner as of a few months ago and the amp is flawless.

Shocking power with very low drive, my radios don?t seem to be transmitting but I see legal limit out !!

I cant say enough good things about my Acom 2000a.
It's nice to know I can drive 10 miles for service if need be.

4118. YB1/N6SS used Acom 1000

Yahoo group: acom-list (2010 — 2016)
Date: 2011-04-16 02:35:51 UTC
From: Jo, YC0LOW®
Topic: 4118 Message: 4118

Just a brief note that during his short visit to Indonesia, Pres-N6SS was QRV on top band (14th April) as YB1/N6SS using Acom 1000.

The amp was used for the first time here and it worked like a champ! About 45W input power from a K3 could result an approximate 1K forward power.

I am very impressed with the silence of it. My old linear is Tokyo Hy-Power HL-2K which I think, now, is too noisy.

Pres - YB1/N6SS netted 47 QSOs from 20 different DXCC countries -with interesting wide EU footprint.

Tnx es 73 de Jo, YCØLOW

Both equipments

Array Solutions and Acom International in Mass are both dealers of the manufacturer Acom Ltd. Of course, warranty repairs should be done by the company who sold the amplifier. For the out of warranty service however, the choice is yours.

John,

Everyone associated with Acom in the USA is in Visalia, CA this weekend for the DX convention. That includes Jay and I from Array Solutions, and Krassy and Will from Acom Intl.

We all work together and collaborate on repairs when necessary. Any or all of us will help anyone who has an Acom amplifier.

So, does it matter where you go for service? Not really. As Val said, if you bought your amp from one of us, it would be better to work with that same dealer for warranty service - but, as in John's case, he's maybe 10 miles from our shop so he should work with us. This only makes sense. No one wants anyone shipping these somewhat heavy pieces of gear across the country unnecessarily.

Thanks for the update Bob.

It sure is nice to be close to the repair shop if needed, I don't expect issues with this fine amp.

I am so impressed with the customer service from Acom in Ma.

I had an issue with Alpha and it turned me OFF from their products knowing the lack of support I would receive
if needed some day.

4122. ACOM Control Software

Yahoo group: acom-list (2010 — 2016)
Date: 2011-04-28 10:40:10 UTC
From: James Thresher
Topic: 4122 Message: 4122

I have recently been working on some new control software for the ACOM 2000, I've just released the first beta version of this on my website. If anyone would like to try it out I would welcome any feedback.

You can grab a copy at www.m0yom.co.uk

The features are basic at the moment but I am planning on adding many more features once I'm happy that the basics are working properly. The main planned feature is the ability to remote control the ACOM over a network or internet connection (this is the reason that I decided to develop this software to begin with, for remote operation of the station).

Please keep in mind that this is very early beta software so there will likely be problems.

Please send any feedback to james@... to save bandwidth on this reflector. If enough people like the software and want to use it then I will consider creating a separate reflector for discussion.

Thanks

73 James M0YOM

Hello James,

thanks for letting the group know about your project.
As a happy owner of an Acom 2000 I will be willing to
test your program as well report to you any useful feedback.

Thank you!

This is awesome, James!

I was involved in the specification of the original software written
many years ago . . . and I would be happy to give you some of the ideas
that came out of that effort. Here are a couple to start!

* Full UI and Compact UI - when running other apps on your screen,
most people just want very basic info about the amp and a tiny UI
in that mode is what is needed
* Automatic Frequency Segment Selection - based on knowledge of the
transmitter frequency from logging software connected to the radio
* Interface to the top free general-purpose logging and contesting
software - DXLab and N1MM

Have fun with this. Your efforts will be appreciated by a lot of users.

4129. ACOM 2000A - Auto Band Switching

Yahoo group: acom-list (2010 — 2016)
Date: 2011-04-29 15:00:30 UTC
From: Norman
Topic: 4129 Message: 4129

To the Group,

Noting James' Control Software Beta announcement and the follow on comments prompts me to seek a solution to my control need.

Simply stated I would like a hardwired Band Switch control line, similar to the ICOM tranceivers to PW-1 amplifier "remote" cable.

My understanding of the ACOM band change mechanism is it is based on RF detection, and a frequency counter to determine drive presence and frequency, which then triggers the band change.

My transceiver is a ICOM 7800 (also a IC-756III) and does provide a DC step voltage corresponding to each band. During contest operation band changes are control by my logging software which I believe is a digital signal to the transceiver.

So, is there a method of triggering ACOM 2000A band changes via some form of direct control and not depend on the RF detection method?

Greetings Norm,
I have the Acom 2000S and 2000SW. It works great. The 2000S "learns" your antenna selection patterns, usually the 2nd time you return to that frequency. At this point, when the amp switches to that band, so does the antenna switch.
In a contest using N1MM it works great ..... N1MM changes the rig, which keys the Acom, which in turn makes the proper antenna selection.
There are several sites with the switch info, this one has the manuals http://www.acom-bg.com/index.php?option=com_content&view=article&id=99:acom-2000s-automatic-antenna-selector-&catid=42:antenna-switch&Itemid=117

Norm,

The ICOM DC step voltage and the other band decoders wouldn't do the job, as 2000A tunings are not per band, but per narrow segments. The amplifier needs information for the transceiver's frequency, not only for the band. This information is available on the transceivers CAT ports, like CI-V of your ICOM.
As Jim suggested, James may try to feed his great Director with a frequency data from the logger.
But if you have some patience, a new device will be offered by Acom soon, allowing CAT connection between 2000A and any transceiver.

Darrell,
Thanks for the response, but I think you missed what I a looking for. I do not have an antenna selection issue, that is taken care of by my transceiver. What I am looking for is a method of direct control of the ACOM amplifier band switching. Either by a control signal from the transceiver or from a command port on the computer.

I note from another response that a CAT decoding capability may be available soon. That capability will address my need.

Regards,
Norm W4QN

Val,

Thanks for the very encouraging news regarding a device to permit direct connection to the transceiver frequency information. I knew that there was both the analog band information and the CAT frequency info available in the ICOM line of radios. I was not aware that the 2000 needed frequency info to optimize the tuning, but it makes sense.

Hopefully the new device will be available shortly - I shall have patience.

73,
Norm W4QN

PS - if there is a need for Beta test, I would be happy to volunteer.

Hi Norman,

I had the same need until i bought the Microham Station Master and his Acom 2000A cable (using in parallel with the MK2R+)
I've a IC-7800 connected with my Acom2000A. The station master with its cable is capable of tracking band changes and let the amplifier
know on which frequency I listen and instantly the acom is adjusting its frequency accordingly.
I don't know if this is really what you need but I would suggest to give a look at:

http://www.microham-usa.com/Products/sm.html

http://www.microham-usa.com/Products/SM/Cables/PA-ACOM-2000.pdf

the Station Master can be used alone without the MK2R+.

I hope this can help you.

Enjoy the IC-7800 and the Acom 2000 ;-)

Hi Norm,

It would be possible to manually change the band on the ACOM 2000A via serial port commands, This is something I am looking to include in a future release of my software.

Integrating this to logging software may be tricky as it would depend on the logging software being used and would need that software to provide some way of retrieving the band or frequency information from it.

A couple of people have asked for Logging software integration in ACOM Director, so this is something I will look into.

Subject: [acom-list] ACOM 2000A - Auto Band Switching

To the Group,

Noting James' Control Software Beta announcement and the follow on comments prompts me to seek a solution to my control need.

Simply stated I would like a hardwired Band Switch control line, similar to the ICOM tranceivers to PW-1 amplifier "remote" cable.

My understanding of the ACOM band change mechanism is it is based on RF detection, and a frequency counter to determine drive presence and frequency, which then triggers the band change.

My transceiver is a ICOM 7800 (also a IC-756III) and does provide a DC step voltage corresponding to each band. During contest operation band changes are control by my logging software which I believe is a digital signal to the transceiver.

So, is there a method of triggering ACOM 2000A band changes via some form of direct control and not depend on the RF detection method?

If you are having trouble with a 1011 you should talk to your dealer about it and they will provide support information to you at no charge.

This is a new model, and is most likely under warranty since it has not been available much more than 2 years.

You may however, download user manuals from the Acom website,

http://www.acom-bg.com/index.php?option=com_content&view=article&id=128&Itemid=136

The detailed technical support information is not free public information but your dealer can provide it to you as an Acom owner.

Do you own one, or are you just looking for additional information?

Radio33 (F5OLS) is the Acom dealer in France.

From: Craig
Topic: 4140 Message: 4140

Hi Folks,

I'm not sure this is an issue or not but please have look at the three you tube videos below showing startup sequence , now when the first two videos are played notice how the motor runs at the end ,on the first two videos its nice and smooth , when you watch the last video which is showing my amp starting you will notice it sounds a little jittery or sticky , can anyone have a listen to their amps an report back.

Any feedback would be greatly appreciated ,
unfortunately for me I strive for perfection. HI

I think you're OK!

The stepper motor noise will vary ...for example:

With the amp's cover removed it will be louder.

Placing the amp on a desk with nothing close to
it the sound will vary.

Placing the amp into a rack the motor noise will also change,

This is due to mechanical noise coupling pick up.
In other words, when the motors initiate the mechanical
noise it is picked up by nearby stuff and it can be amplified.

How many times do you hear a station with amp noise in
the background? and the operator realizes his amp is on
the same desk as the microphone stand is...he is getting
mechanical noise coupling. He moves the mic away or
relocates the amp and the rumble is gone [I'm not discussing the blower noise rather mechanical hum from the amp itself].

If your amp times out properly at start up, and you have normal operation, and all your parameters are within specifications
leave the amp alone.

After owning one of these since 1998, and also after testing and shipping dozens of new units over the last few years, I can certify that your amplifier and its stepper motor noises on startup are 100% normal.

The amount of noise and duration will vary somewhat depending on where the amp was tuned when it was shut off.

You will also hear a varying amount of sound when you change bands. Less when you go from one band to the next (20 to 17m for example) and more when you go from, for example, 160 to 10m and so on.

I'm on my second 2000. Sold the first about 4 years ago. I saw the light
and got another.

My first impression on start up was "boy this one is really loud on
first startup".
Of course that was my recollection and could have been wrong. However
this has been confirmed by listening to the links here. It sounds about
10x louder than the first U tube link here. It's almost as if something
is attached to a sounding board to exaggerate the noise.

Any suggestions on a muffler?

You have a tremendous amp that kicks butt over anything on the market !!

I love my 2000a and would never consider selling it.

It is a tank ! Turn it on, it calibrates and you are ready to ROCK !

Don?t worry about what little noises you here, does it put out ???
It most certainly does !

As Bob said...Its good !

4148. Tuning

Yahoo group: acom-list (2010 — 2016)
Date: 2011-05-16 15:02:57 UTC
From: Craig
Topic: 4148 Message: 4148

I have a question re the Acom 2000
I want to compare it to the Acom 1010

Ok on Acom 2000, 10m band the segments are 300 khz wide
So we tune at say the centre say on 28.150 right?

When I use my Acom 1010 if I centre on 28.150 for perfect tuning and I change the freq the radio to 28.000 or 28.300 then the indication lights indicate I must adjust the tuning for optimum performance which is achieved when making the necessary adjustments.
I have also noticed if your SWR is better say at 28.000 than at 28.300 then more re tuning is required at 28.300

Now my question is this, should the segments on the Acom 2000 be narrower on 10m for better performance and more accurate tuning or does this just apply to the manual tuning of the Acom 1010

What do you think?

OM,

Thanks for the 20 and 30M QSO's.

Yes, the tuning segments are 300 KHz wide for 10M for the ACOM2000.
They appear adequate here with my tribander on 10M. However, I tune
them not for the center of the segment, but for the frequency that is
the average of the top+bottom segment SWR.

Depending upon how narrow band your antenna is, this may not be enough
to operate the 1010 over the entire segment without retuning. Don't
know anything about the 1010.

On 160M the ACOM 2000 segments are 25KHz wide. These are too wide--
especially as one gets away from antenna resonance. Antennas can be
pretty narrow banded on 160M.

My Pleasure OM,

and tks for the reply,

when you say "However, I tune them not for the center of the segment, but for the frequency that is the average of the top+bottom segment SWR" what do you mean by this ?

on 20m where i've only really used the amp so far i tune on 14.030 14.150 14.250 and 14.325 this is becsue i dont really TX between 14.060 and 14.100 very much so i see no point in tuning on 14.050 is this what your refering to ?

Rich and others,

I have a the Acom 10 port antenna switch, still in the box and never used if anyone is interested.

4154. Are Will and Krassy OK?

Yahoo group: acom-list (2010 — 2016)
Date: 2011-05-31 03:39:54 UTC
From: hvwhvw
Topic: 4154 Message: 4154

On about May 4th I called Will about my 2000a. We discussed the problem and he said send it to him and he would see to it right away. I shipped it on May 5th. I called Tuesday the 10th and he had said he had not received it. I tried calling him again Thursday the 12th but could not get him. The phone numbers on the Acom site said they were temporarily disconnected. His cell phone did not answer so I left a message. I found that when they work all the numbers listed on the Acom site ring to Will's cell phone. Called again on following days and was unable to reach him. Finally on Tuesday 24th I got him and he said he was home sick but he would call me as soon as he got back to the office. I tried again Friday (27th) and could not get him. Called Bob at Array Solutions thinking he might have heard something. He said he has not spoken with Will in a very long time. He mentioned that had heard from someone else that was having similar problems. I sent Will and Krassy an email expressing my concern. Still no response. Does anyone know if they are ok?

Many thanks.

Hal - K4HW

Krassy operated in the CQ WPX CW contest this weekend. He posted the winning score in the USA SOAB HP category. I'd say he's just fine.

4161. Acom 1000 rattling noise

Yahoo group: acom-list (2010 — 2016)
Date: 2011-06-08 22:35:52 UTC
From: Seli O
Topic: 4161 Message: 4161

Hello all,
I own an Acom 1000 and has performed very well.
Just a small problem this evening. When it has heated up for the normal time and I push the OPER button, I have a rattling noise, like a relay that doesn't contact normally. This noise disappear when I have left the amp alone for 5-10 minutes.
What to look for, or don't worry at all?

73 Seli TF3AO

4162. "Auto protection:PR26"

Date: 2011-06-09 11:09:05 UTC
From: Andrew Cowan
Topic: 4162 Message: 4162

Been having some problems with my Acom 1000 after a short time it will "Auto protection:PR26"

I have left it on standby for a number of hours and it has no faults, I put the radio on tx with no drive for 30mins plate current at 80ma no fault, than I tuned up the amp with drive and it tripped "Auto protection:PR26"

I have copied the fault codes below

1ATR6B 000006 0F0000
1BAD98 7720DE D77FD7
2ASB2B 000000 000000
2BAF9D 0320DC D77FES
3ASB2B 270000 000000

Hi Andrew,

I would take a good close look at your antenna relay K1. Looks like it may be at fault. The previous faults also indicate a problem there.

Hi Seli,

Remove the KEY IN cable from your Xcvr to your amp. When removed and you push the OPER button does the noise show up ? I would be concerned about such a noise.

Hello again,

Got a direct e-mail from Raymond, GM0VRP, where he wrote:
"At the start of the year I had a rattling noise which I thought was coming from behind the front cover,
I opened the amp up looked behind the front cover could here the rely chattering away which I thought was faulty.
A closer inspection was an electrolytic capacitor 25V, 3300UF on the main board had gone once this was replaced all was well again
In the pictures you can see the faulty capacitor"

I opened my amp. and yes, the same story with the capacitor. So it's already out now, and plan to replace it as soon as I get a correct cap.
For visual inspection I have uploaded, with permission, Raymonds pictures in the photo section of the reflector.
My pictures will be uploaded later.

The electrolytic caps in the older ACOM amps seem to be a common problem. Some of the older amps have Bulgarian-made electrolytic caps (logo with the letter K and capcitor circuit around it) and these often fail. When I bought my ACOM 1000, the ams was 4 years old and very lightly used. I had to replace a whole bunch of electrolytic caps - most of them on the main board (not the PS) have leaked electrolyte or looked swollen (similar to the condition known as "capacitor plague"). Never had a problem since I replaced them.
I've heard of other people having problems with electrolytic caps in these amps - at least replacement caps are easy to find and inexpensive.

Topic: 4161 Message: 4170

This capacitor is made by Hitano, also marked "ECR VENT 2B15" and the PCB is marked "SEP - 2001".
There are 2 shops in Reykjavik I could get this capacitor from, but this week they are both closed, so have to wait until monday. Today the 17th of June, we are celebrating our Independence Day.

Time for a repair.
Warms up, but when it then is about to play its song and switch to standby, I get message "Bias Too Low At Power ON -000 Volts".

Is this an easily repairable problem, Or should I pack to ship?

Ken K5WK

Could be a defective final tube, or other componentns, but likely the tube.

Just replaced the capacitor in question and bingo, everything works fine now. Have uploaded 3 pictures, but they are not as good as GM0VRP's pictures. Thanks again Raymond for info on your repair.
Suggest to others to take the top lid off and look if this capacitor is OK.

Hello all.
I tryed to find how to select the jumpers inside the Acom 1010. I need to change from 220V to 110V and the manual doesn´t show it.

Thanks and 73,

Eduardo - PY1EB.

This sounds like a big scam to me. You don't take credit cards or Paypal payments. Are people really this stupid? The write-ups about you on QTH are pretty damning too. Do you really expect someone to send you a cashiers check for that kind of money for an amp that they may never see or that may be in substandard condition.

4184. FOR SALE: RARE ALPHA 6 50 MHz 2 KW 6 METER HAM RADIO AMPLIFIER

Yahoo group: acom-list (2010 — 2016)
Date: 2011-06-26 18:41:27 UTC
From: D G
Topic: 4184 Message: 4184

Alpha 6 is a Custom-Built, Very Limited Edition 6 Meter Amplifier conservatively rated at 1500++ Watts Output Continuous 100% Duty Cycle on 50-54 MHz tunable up to 2 KW, made by Alpha Power as a Custom Order and Very Limited Edition using a Single, Robust 4CX1600B (Svetlana GU-91B) which is very affordable and readily available. Only 10-20 Watts drive delivers 1 KW Output and that is 100% Continuous Duty Cycle (unlike solid-state amplifiers).

Alpha 6 Features:

Single 4CX1600B Ceramic-Metal Tetrode providing a maximum plate dissipation of over 1.6 KW
Supports the Entire 6 meter Amateur Radio Band 50 MHz ? 54 MHz
Comfortably delivers Full Legal Limit on the 6 meter band in All modes
Hypersil 3.5 KVA transformer
Grid & Screen Current Limiting Protection
Protection Circuit for Excessive SWR, Average Plate Current, RF Arc, Mistuning, HV Fault, HV Crowbar, Power Interlock, etc.
Supports 90-130 Volts AC, 190-250 Volts AC, now wired for 220 Volts AC
No Duty Cycle Limitation ? 100% Carrier, Key Down with included optional Cooling Fan
Rugged Construction ? Built like a Tank
Alpha Collector?s Item and Serial Number 2

This Alpha 6 is in Mint Condition with the Optional Auxiliary Cooling Fan, Original Alpha 6 Owners Manual and both Alpha Cartons for Amplifier and Transformer (shipped separately) and has just been sitting on the shelf rarely used and as Collector?s Item as Serial Number 2. Alpha now charges over $4600 for their Alpha 8406 which is of the same design, this Alpha 6 is a Collector?s Item and Serial Number 2 and Mint at $3500 plus shipping and insurance or Cash & Carry.

Dennis, There are pages and pages of comments from people doing business with you. I stated no opinion nor did I ever have any business dealings with you. I have not resorted to name calling. I have simply brought to everyone's attention that which simply exists. Your issue is not with me. It is however with those who have written about you. Do you have an issue with me for bringing attention to public record?
Respectfully Paul w8jn

Paul:

1) You should know better that there are two sides to every story.
2) It is not your place to spread slander and heresay, especially as you admit, you know nothing, nor have not done business.
3) This is a forum and user-group for ACOM Amplifiers, not old-lady gossip that you circulate.
4) You should spend more time operating and less time harassing and obsessing others in areas that are not your business.

I should not even waste my time with a busy-body gossip like you.

4197. News from Acom

Yahoo group: acom-list (2010 — 2016)
Date: 2011-06-27 06:54:36 UTC
From: Hans Remeeus
Topic: 4197 Message: 4197

Hello Acom-friends!

Just came back from a few days Ham Radio Fair 2011 in Friedrichshafen.

For the first time after 15 visits I met Acom with their own stand.

Very professional, with very friendly Acom people! Great!

News:
- 800 Watt solid state linear
- very good looking new remote control for the Acom2000A... A 'must have' item ;-)
- power combiner for three Acom2000A for 5400 Watt output
- professional remote controlled antenna tuner for coax and open feeder (very very expensive)
- 12 Volt power supply

I have photos from the solid state linear, the new remote control and the antenna tuner.

Hello Acom-friends!

Just came back from a few days Ham Radio Fair 2011 in Friedrichshafen.

For the first time after 15 visits I met Acom with their own stand.

Very professional, with very friendly Acom people! Great!

News:

- 800 Watt solid state linear

- very good looking new remote control for the Acom2000A... A 'must

have' item ;-)

- power combiner for three Acom2000A for 5400 Watt output

- professional remote controlled antenna tuner for coax and open feeder

(very very expensive)

- 12 Volt power supply

I have photos from the solid state linear, the new remote control and

the antenna tuner.

Hans,

Why is the ACOM2000A remote control a "must have"? It appears to have the same functions as the old unit. The two buttons saying Yaesu and CAT do seem new. If this unit replaces the CAT protocal/language so that the amp can actually be used by windows programs with simple software, then it may be worth it. I'm hoping it would now be the equivalent of ALPHA MAX. Doubt it though.

Thank you for the update.

I cant wait to view the photos.

I would like to find some details about their NEW solid state amp.
I wonder if I can run it mobile.

I love my 2K !

Yes - it will be available as an upgrade unit for older 2000A amplifiers.
The projected price in Europe is 482 Euro - in the US - probably about
$700.

Look at my earlier post in this thread for links to the photos.

Details are not published, but it appears that interfacing to the various
"standard" radio types will be supported through the new controller.

Topic: 4197 Message: 4211

> - power combiner for three Acom2000A for 5400 Watt output

Out of curiosity, which countries allow 5.4 kW HF power limit for amateur radio operators? Such monster would also require over 10.5 kW AC mains - I am afraid my utility company would refuse to install an extra pole transformer :-)

Does ACOM's new combiner contain a reject load to absorb power when complete balance is not attained (e.g. during manual or automatic tune-up)?

4215. Re: [acom-list] News from Acom

Yahoo group: acom-list (2010 — 2016)
Date: 2011-06-27 16:45:38 UTC
From: Paul Christensen
Topic: 4197 Message: 4215

Interesting. Here in the U.S., external amps require certification prior to commercial manufacture and/or importation, but power dividers/splitters do not (yet, anyway). Looking at Sec. 97.317(c), the FCC can revoke certification if it determines any of the following:

(1) Any accessible wiring which, when altered, would permit operation of the amplifier in a manner contrary to the FCC Rules;
(2) Circuit boards or similar circuitry to facilitate the addition of components to change the amplifier's operating characteristics in a manner contrary to the FCC Rules;

(3) Instructions for operation or modification of the amplifier in a manner contrary to FCC Rules;

(4) Any internal or external controls or adjustments to facilitate operation of the amplifier in a manner contrary to the FCC Rules.

Whether or not any of these terms in the FCC rules is violated when a splitter/combiner is specifically designed for use with a currently certified amp will be based on how they interpret or subsequently modify the rules.

Paul, W9AC

Brian,

I too wonder what the new remote unit will do over the old? Can we simply use new software on the old unit?

Heck one's electric range can draw more than 10.5 kW. If your house already has 200-300 amp service, I doubt the utility will need to do anything.

It's not a 5400W amplifier, it's a transmitter combiner; the 5.4KW means the sum of the inputs, with outputs to one antenna on different bands. This doesn't fit most amateur applications, but you could (theoretically) operate 3 rigs on different bands at 1500W output each (3x1500W=5400W). Big power hog and you'd need big load resistors (circulators) to avoid sending RF in the wrong directions. Also you'd be one very busy operator during the contests!

Appears to me this is a military/commercial application which (for some reason?!?) they chose to throw into their amateur catalog.

Let me know when you get yours on the air!
;-)

Hello,
just uploaded some pictures taken during the weekend at the Ham radio 2011 show. ACOM presented the new remote controller for 2000a, the new solid state amplifier and also a very nice power meter.
All new toys looked very good and will be available in a couple of month.
best wishes

Hanno, DK3HV

Hi Brian & Steve,

I have no idea about the features of the new remote control, just what we can see on the picture.
It has a large color display, I can see has control for antennas (I guess Acom SW2000 remote antenna switch), CAT control, etc.

So, it is much more nice than the actual one.
If it can run Windows or not, I have not idea, but I like it.
I understand the word from Hans "a must" in the same way I think, "I would like to get one".

Let´s wait to Acom publish the full list of features.

Well done Acom !!

Probably not - as long as I operate when my wife is not cooking and runing the dryer at the same time and it is not on a hot day so I dont have to turn the central AC :)

..still.. I dont see any practical use for 5.4 kW setup...the story of the sheikh (A61AQ) who melted a SteppIR beam with russsian submarine 6kW amplifier (10x GU-84B) comes to my mind :)

Andrey - 10.5 KW is not an extraordinarily high load. If you have a heat pump at your home, it probably has backup heat strips that range from 7KW to 12KW. You electric range on a 50 amp branch circuit is rated for 12KW.

Without looking into the math for calculations, I'd guess my Miller 180 amp square wave TIG welder is drawing a hundred times my Acom ! ;) And thus far, no one has been knocking on my door to ask questions.

From: n0hr_pat
Topic: 4224 Message: 4224

Any word on pricing, availability (in the US), and specs of the ACOM 800S solid state amp? Pictures look great.

How will it compare to the SPE Expert 1K-FA
http://www.radio-ham.eu/Expert1K-FA.htm

the Tokyo High Power:
http://www.tokyohypower.com/hl-1_2kfx.html

or other solid state amps on the market?

CAT ability? SO2R? autotuner?

Looks interesting.

Hello Brian,

What I have seen and heard about this new RCU for me it is definitely a 'must have' item, instead of 'nice to have'.

- More features; waiting for the specifications
- Better ergonomics
- Much bigger display
- Colour display
- Reasonable price

4232. RE: [acom-list] News from Acom

Yahoo group: acom-list (2010 — 2016)
Date: 2011-07-01 11:56:27 UTC
From: Bob Naumann
Topic: 4197 Message: 4232

About $3500 for the amp and about $600 for the new 2000A remote.

tnx Bob,, did they give an expected ship date, and does the new
remote require any hard or soft changes to the 2000A??

4234. RE: [acom-list] News from Acom

Yahoo group: acom-list (2010 — 2016)
Date: 2011-07-01 12:40:51 UTC
From: Bob Naumann
Topic: 4197 Message: 4234

The answer was "maybe by the end of this year" for all new products. All pricing given thus far are estimates only.

No details on what, if any, mods will be required for the 2000A. I do have some questions pending with the factory however requesting these details among others.

The Acom staff is busy with sponsoring a Bulgaria Field Day event this weekend so no response is expected until next week sometime.

-Bob

Hello

I purchased an ACOM1000 with a front bezel I have never seem before in any photos. Just hoping someone can tell me about the age of this amplifier. I uploaded a photo in the photos section.

Thanks, Randy/n4jzy

It's not clear from the photo what the black edge is on the front panel, but this is something the previous user must have added. I've never seen this before.

It is extremely uncommon to find someone on any forum or ebay who has so many complaints who is a straight-up guy who is being maligned by a conspiracy of people who don't even know each other. I take these reviews very seriously.

I would never do business with someone who had that many complaints.

4240. ACOM Director 0.4.0 (Beta) Now Available

Yahoo group: acom-list (2010 — 2016)
Date: 2011-07-08 17:28:04 UTC
From: James Thresher
Topic: 4240 Message: 4240

It's taken a while longer than I'd hoped due to work commitments, but ACOM Director 0.4.0 (Beta) is now available.

There are many changes and enhancements in this version, The remote control (over network or internet) capability isn't quite ready yet so this will be in version 0.5.0. I have listed details of the changes below. The biggest change is that the application will now run as a small icon in the system tray (the icons in the bottom right of the screen in windows). Double clicking the icon will display the control panel, right clicking it will give a set of menu options.

If you are using Vista or Windows 7 then you may need to right click the icon and choose "Run as Administrator" the first time you run the new version.

I have also added a dedicated page to my website for the software with some information about the cable type that is required to connect the PC to the ACOM 2000. This can be accessed here
http://www.m0yom.co.uk/index.php/acom-director-acom-2000-control-software

Thank you for all the feedback so far, it has been extremely valuable and I would welcome any further comments on this latest version

0.4.0

FIX: The red Fwd Power and Rfl Power LED's were not gradient shaded when lit.

FIX: Exit menu option did not work

FIX: The Forward and Reflected power indicators would often show an extra led when compared to the RCU

NEW: Added splash screen

NEW: Overhaul of the UI Logic, seperated out to support multiple UI's

NEW: Overhaul of the ACOM2000A State Management in order to support multiple UI's

NEW: Application now runs with an icon in the system tray

NEW: Added the ability to keep the control panel window on top of all other windows

NEW: Added improved error handling with the ability to email back error details for quicker debugging of problems

NEW: New Single Instance system added to stop multiple copies of the application being run

NEW: Added new mini version of the control panel

NEW: Removed the drop down menus from the control panel screen, these are now available by right clicking on the system tray icon

NEW: Double clicking the system tray icon now displays the control panel window

NEW: Closing the control panel window no longer closes the application, you must right click on the system tray icon and select "Exit" to quit

NEW: Added the ability to support many different control panel types in the future

NEW: Control Panel Window position is now remembered

NEW: Each type of control panel remembers it's window position independently

NEW: Removed the ability to minimize the control panel windows as closing them serves the same purpose

NEW: Added the ability to choose between control panel types and switch types on the fly

NEW: Added the option to show the control panel on startup

Yes! Thanks for good work! I installed the newest version v. 0.4.2 this evening and it works. One bug I noticed in the first version that I still see in this one is that I can't read the HV parameter. It reads OK on the hardware controller and on the 'factory' software remote.

BTW...I'm pouring concrete tomorrow on the tower foundation for my new remote controlled station that will use the ACOM2000A with the M0YOM software!

Hi Ron,

Thanks for your comments,

I have now found the cause of the HV measuring problem, this has been fixed in the next release.

I hope the concrete pour goes well, I would be very interested to hear about your new remote station once it's up and running. I hope the software works well for you.

I have listed details of the changes below. The biggest change is that the application will now run as a small icon in the system tray (the icons in the bottom right of the screen in windows). Double clicking the icon will display the control panel, right clicking it will give a set of menu options.

If you are using Vista or Windows 7 then you may need to right click the icon and choose "Run as Administrator" the first time you run the new version.

I have also added a dedicated page to my website for the software with some information about the cable type that is required to connect the PC to the ACOM 2000. This can be accessed here
http://www.m0yom.co.uk/index.php/acom-director-acom-2000-control-software

Thank you for all the feedback so far, it has been extremely valuable and I would welcome any further comments on this latest version

0.4.0

FIX: The red Fwd Power and Rfl Power LED's were not gradient shaded when lit.

FIX: Exit menu option did not work

FIX: The Forward and Reflected power indicators would often show an extra led when compared to the RCU

NEW: Added splash screen

NEW: Overhaul of the UI Logic, seperated out to support multiple UI's

NEW: Overhaul of the ACOM2000A State Management in order to support multiple UI's

NEW: Application now runs with an icon in the system tray

NEW: Added the ability to keep the control panel window on top of all other windows

NEW: Added improved error handling with the ability to email back error details for quicker debugging of problems

NEW: New Single Instance system added to stop multiple copies of the application being run

NEW: Added new mini version of the control panel

NEW: Removed the drop down menus from the control panel screen, these are now available by right clicking on the system tray icon

NEW: Double clicking the system tray icon now displays the control panel window

NEW: Closing the control panel window no longer closes the application, you must right click on the system tray icon and select "Exit" to quit

NEW: Added the ability to support many different control panel types in the future

NEW: Control Panel Window position is now remembered

NEW: Each type of control panel remembers it's window position independently

NEW: Removed the ability to minimize the control panel windows as closing them serves the same purpose

NEW: Added the ability to choose between control panel types and switch types on the fly

NEW: Added the option to show the control panel on startup

Hi James,

Dumb inquiry.
I don't see anywhere to download version 0.4.2 on the webpage.
Did click on latest updates and get a done. But I don't see anything
saved anywhere.

Hi Brian,

Here is the direct link to the downloads page

http://www.m0yom.co.uk/index.php/downloads/category/2-acom-director

You should be able to download 0.4.2 from there.

Try Array Solutions.
They just repaired my ACOM 1000 and I was without my amp for only 2 weeks. It would have been just 1 week however they had a little shipping problem....

Hi Brian,

The application now puts an icon in the windows system tray (next to where the date and time is displayed in the bottom right of your screen)

If you right click on the icon (it's a blue ACOM logo) then you will get a menu displayed, the top option is configuration which will allow you to change the COM port.

Got it. Works. Looking to the version that reads HV correctly.

Pretty neat. The parameter display scrolling/selection seems to have
some problem. I scroll down to show tube filament voltage in the list
and move over to click. The list zips back up to the top of the
parameters list. One can eventually select stuff but it's not solid.

I do note that exiting it by clicking on the upper right X does not end
the process. To really end it, one must end via the task tray ICON. Is
that intended?

73 & good work
Brian/K3KO

I had no luck at all with a program that simply wanted to change from
one antenna to an alternate in a given segment. Kept getting into
infinite loops of garbage. Glad someone figured out the contorted
system used by ACOM.

Hi Brian,

Yes, exiting by clicking the X is not intended to close the application, this is new in this version. One of the features that I'm adding in a future version is for background notifications, so if you didn't want to show the control panel it would still inform you if for example you peaked over a set power threshold or if the amp tripped into standby.

I wasn't aware of the problem with selecting the measurement metrics, it is probably related to the new multiple control panel code as I'm pretty sure it was working properly in 0.2.0, I'll look into this.

The control protocol is certainly strange to say the least, it did take quite a bit of working out (and I'm not entirely there yet, some control commands still need figuring out)

4253. ACOM Director 0.4.3 (Beta) Now available

Yahoo group: acom-list (2010 — 2016)
Date: 2011-07-10 09:01:11 UTC
From: James Thresher
Topic: 4253 Message: 4253

ACOM Director 0.4.3 is now available, this is a bug fix only release and should cure a number of issues that were stopping some users from being able to run the application.

Head over to http://www.m0yom.co.uk/index.php/downloads/category/2-acom-director to download this version.

The main change is that the location of the configuration file has now changed, this used to be stored in the program files folder along with the application files, however this appears to have been causing some users permissions problems, so it is now stored in the user's application data folder. This means that unfortunately you will have to re-configure ACOM Director the first time you run this version.

Changes in this version

0.4.3

FIX: When measuring HV the figure displayed did not match that displayed when measuring HV using the RCU

FIX: Some users experiencing a System.UnauthorizedAccessException when trying to save the config file, config file is now stored in the users 'Application Data' folder

FIX: Configuration Dialog box causes error on some machines due to windows reporting duplicate COM ports (System.ArgumentException Message : An entry with the same key already exists.)

FIX: The Measurement Metric drop downs were "Jumping" around and not easily allowing the user to pick a measurement item on large control panel interface

Hi James,

Thanks for these fixes. The drop down parameters box now works fine.

However, I've run into the dreaded:
"ACOM DIRECTOR has encountered a problem and needs to close"

It does not occur if one is NOT monitoring a metric. It showed up when
I was trying to monitor plate current and plate voltage while
transmitting. Reproducable.

Another item of interest. If I connect DIRECTOR to the 2000 while it is
warming up, DIRECTOR tells me POWER IS OFF. I seem to recall it
previously echo'd the warming up test on the ACOM remote head.
(Recollection could be wrong) Once warmed up, the DIRECTOR display is OK.

Hi James,

good work for the 0.4.3 beta.
Moreover on the list of problems noted by Brian.
I left my AcomDirector running during the entire IARU HF Contest.
I noticed this morning, after 3 hours sleeping that the
metrics (Metric a = Mains, Metric b = reflected power)
were not updated. Values were frozen at some values.
I needed to stop / start the measurements to keep the program showing the live values.

Hi Brian,

Thanks for the feedback, Does the "ACOM Director has encountered a problem" error only occur when measuring Plate Voltage or does it also do it when measuring other items?

The software will display the warm up message, but only if it's connected before the ACOM2000 is turned on, this is because the ACOM2000 only sends the message to say it's warming up once at the start of the power on sequence, if ACOM Director is connected during warm up then it can't tell if it's powered off or not until the warm up is complete.

Thank you James,

I would like to check if you have in the wish-list
the station master Protocol.
I was running your program directly connected with an USB/Serial converter.
Worked like a charm but I'm interested to use the built-in serial port available on the Microham Station Master.
Not a big deal .. just a reminder ;-)

Keep up your good work!

Hi Fulvio,

Yes, I've got the use of the Station Master for connection to the ACOM in the wish-list, I'm not sure if it will be possible to achieve yet or not as MicroHam don't publish the full protocol, I will be emailing them once version 0.5.0 is finished to ask them for a full spec on the Station Master and MK2/MK2R/MK2R+ control protocols.

Array Solutions is a repair center and dealer for ACOM amplifiers (Bulgaria).

So if you need warranty work we can help you out as well.

You don't need to buy the amp from us to have it serviced later.

I hope that clarifies things a bit.

Regards to the group.

For those of you not familiar with Array Solutions, I can assure you that these guys are as good as it gets. The reason that I purchased the Acom 1010 was that it was sold and serviced by Array Solutions. Their reputation is excellent.

4266. ACOM Director 0.5.0 Beta Now Available

Yahoo group: acom-list (2010 — 2016)
Date: 2011-07-17 11:50:15 UTC
From: James Thresher
Topic: 4266 Message: 4266

ACOM Director 0.5.0 (beta) is now available for download

http://www.m0yom.co.uk/index.php/acom-director-acom-2000-control-software

This version now has the ability to remotely control the software over a network or internet connection. Please note that this is very experimental functionality and will likely have some issues.

As these capabilities use the network/internet it will be affected by firewalls. I would be particularly interested in feedback from people who try this feature out. Performance & stability reports would be very much welcomed.

0.5.0 Release Notes

FIX: Object reference not set to an instance of an object. could sometimes be generated when closing the control panel

NEW: Completely New Installation Routines

NEW: Added the ability for the software to operate remotely over a network or the internet

NEW: Restructured ACOM Message processor for easier maintenance

NEW: Software now released under the BSD 3-Clause License

Hi James,

thank you for your great ham project !
Just the first feedback ;-)

still trying to install the new 0.5.0 (beta) but the program would not allow me to install it
under a network drive (in my case H:/Hamradio/AcomDirector)
It tells me that it should be installed only to a local hard drive.

I have the previous version installed and running flawlessly.

Thanks James again for the quick turn around on your versions.

I used the previous one and had no issues, its pretty slick and has a nice display.

I run this in the back ground to keep an eye on things even though I don't think I could ever hurt my 2k.
Its a brick and more solid than an alpha.

Keep up the great work and thanks again for a great product.

Hi John,

The 2000 is extremely well protected, it would take lot to cause one a problem I think.

I am glad the software is working well for you. I am aiming to have all the features I have planned implemented before the winter. So more releases will be coming very soon.

I just loaded up the new remote version 0.5.0 and it works great! There was one startup problem, probably due to the settings on the client side not having been set right, but once done and the program restarted on both ends, it connected right away and is currently working fine over the LAN.

Many thanks for a great job James!

The only real problem I'm having is in the startup sequence. Both the server and client software have to exited, the amplifier turned on, then both ends of the software restarted. I ran it over the weekend chasing the Southern Sudan DXpedition and other than the startups, it ran great!

4275. clean you air filter

Yahoo group: acom-list (2010 — 2016)
Date: 2011-08-01 00:53:41 UTC
From: kamarty456
Topic: 4275 Message: 4275

It's been a while, so here is your reminder to clean your air filters.

This is often overlooked and the ACOM amps prefer a clean filter and maximum air flow!

A few minutes doing this can possibly eliminate future problems

Martin KA7GKN

4278. FOR SALE: RARE ALPHA 6 50 MHz 2 KW 6 METER HAM RADIO AMPLIFIER

Yahoo group: acom-list (2010 — 2016)
Date: 2011-08-08 03:21:25 UTC
From: n3dg
Topic: 4184 Message: 4278

Alpha 6 is a Custom-Built, Very Limited Edition 6 Meter Amplifier conservatively rated at 1500++ Watts Output Continuous 100% Duty Cycle on 50-54 MHz tunable up to 2 KW (LED Wattmeter Scale up to 2500 Watts), made by Alpha Power as a Custom Order and Very Limited Edition using a Single, Robust 4CX1600B (Svetlana GU-91B) which is very affordable and readily available. Only 10-20 Watts drive delivers 1 KW Output and that is 100% Continuous Duty Cycle (unlike solid-state amplifiers).

Alpha 6 Features:
☐ Single 4CX1600B Ceramic-Metal Tetrode providing a maximum plate dissipation of over 1.6 KW
☐ Supports the Entire 6 meter Amateur Radio Band 50 MHz ☐ 54 MHz
☐ Comfortably delivers Full Legal Limit on the 6 meter band in All modes
☐ Hypersil 3.5 KVA transformer
☐ Grid & Screen Current Limiting Protection
☐ Protection Circuit for Excessive SWR, Average Plate Current, RF Arc, Mistuning, HV Fault, HV Crowbar, Power Interlock, etc.
☐ Supports 90-130 Volts AC, 190-250 Volts AC, now wired for 220 Volts AC
☐ No Duty Cycle Limitation ☐ 100% Carrier, Key Down with included optional Cooling Fan
☐ Rugged Construction ☐ Built like a Tank
☐ Alpha Collector's Item and Serial Number 2

This Alpha 6 is in Mint Condition with the Optional Auxiliary Cooling Fan, Original Alpha 6 Owners Manual and both Alpha Cartons for Amplifier and Transformer (shipped separately) and has just been sitting on the shelf rarely used and as Collector's Item as Serial Number 2. Alpha now charges over $4600 for their Alpha 8406 which is of the same design, this Alpha 6 is a Collector's Item and Serial Number 2 and Mint at $3000 plus shipping and insurance or Cash & Carry.

Posted: Tue Aug 24, 2010 6:47 pm Post subject:well Dennis got another victim.....ALMOST.....

I had a BEAUTIFUL ONE OWNER panasonic RF-4900 on the board and he contacted me about it .....

he didn't give me his call sign and in fact toldme he was NOT a HAM.....

and that they needed a radio for the church.....

I dropped $65 off of the price AND ate the shipping because I was TRYING to do something nice for the church..... good karma and all that.....

he received the radio today and IMMEDIATLY filed a complaint against me with paypal demanding 1/2 of his money back...$80.....

I told him that I would happily refund 100% of his $ if he sends the radio back..but he seems not to be interested in that...

I even told him if he would like (to save him on the shipping) that I would DRIVE there (he lives about an hour away) and pick the rig up from him and give him ALL his $ back (including what I spent in shipping)

instead wants to KEEP the radio and me give him $80 dollars back

I ripped him off, he is going to prosecute me for mail fraud etc etc

i looked his shipping address up online to get directions in case I needed to drive down there and lo and behold I found out quite a bit about Dennis.....

he STILL insists that I am trying to rip him off but will NOT return the radio for a refund and has told me if I come there to pick it up he will call the police

as it stands I told paypal that I would refund ALLhis $ and he immediatly dropped his claim

so ANOTHER heads up about Dennis radiodg@... to top

Hey Hoss Trader Glassman !

Interesting story indeed, but just a story, but he's lying and I reported him to law enforcement.

Posted: Tue Aug 24, 2010 6:47 pm Post subject:well Dennis got another victim...........ALMOST.....

I had a BEAUTIFUL ONE OWNER panasonic RF-4900 on the board and he contacted me about it ....

he didn't give me his call sign and in fact toldme he was NOT a HAM......

and that they needed a radio for the church.......

I dropped $65 off of the price AND ate the shipping because I was TRYING to do something nice for the church......... good karma and all that........

he received the radio today and IMMEDIATLY filed a complaint against me with paypal demanding 1/2 of his money back...$80.....

I told him that I would happily refund 100% of his $ if he sends the radio back..but he seems not to be interested in that...

I even told him if he would like (to save him on the shipping) that I would DRIVE there (he lives about an hour away) and pick the rig up from him and give him ALL his $ back (including what I spent in shipping)

instead wants to KEEP the radio and me give him $80 dollars back

I ripped him off, he is going to prosecute me for mail fraud etc etc

i looked his shipping address up online to get directions in case I needed to drive down there and lo and behold I found out quite a bit about Dennis........

he STILL insists that I am trying to rip him off but will NOT return the radio for a refund and has told me if I come there to pick it up he will call the police

as it stands I told paypal that I would refund ALLhis $ and he immediatly dropped his claim

so ANOTHER heads up about Dennis radiodg@... to top

Posted: Sun Apr 05, 2009 11:18 pm Post subject: pennradio, AGAIN ! AKA N3DGHeed the warnings about this "dealer". Excessive shipping, very non-professional down right filthy , lazy packing methods. Abusive with the statements after the sale.

I bought an Elmac power supply from this person. It arrived with absolutely the WORST, most thoughtless packing job I have ever seen..period! The item would have been fine but arrived with substantial damage. The seller stated he would have the item PROFESSIONALLY PACKED and at $50 for a 12 pound item, the buyer had every right to expect a decent packing job. It was not at all! The power supply was wrapped in used plastic shopping bag and tossed into a box about 3 inches larger all around. There was also a USED air pillow thrown in. Of course the air pillow was punctured anf the item thrashed around bending the cabinet corners, knocking off paint and finally crushing the bakelite power connector. When pennradio was made aware of the damage from his pi$$ poor packing job he simply referred me to file a claim with the shipper. (BTW ,The ad stated the $50 was for UPS shipping and pro packing but he shipped VIA Fed-X) Of course in most cases it is the
SHIPPER who files the claim and with the packing job at fault the shipper. The carrier, Fed-X was not responsible for the damage resulting from lousy packing.. The actual shipping cost was only about $12 allowing the seller to pocket $38 on an item that sold for $40 at auction!
The seller refused to make the situation right until a Paypal judgement went against him. I CAREFULLY repacked and returned the item to him. Almost as soon as he received the item he re-listed. He used the original ebay listing description , photos and all. He never mentioned in the listing the damage.

In the meantime of course I did a bit of homework. Seems I am not alone here. This guy has earned quite a reputation. My little deal pales with some of the other reports on this operator. Selling Icom freebies ? Ridiculous shipping fees. Questionable goods , WOW. I actually received Ebay statement at a SPAM level. Nearly 20 in the first day after the auction end! Seems he has done that crap to others as well.

Check out some of the other amateur radio selling venues. You can easily search under his call sign as well as pennradio.

Better know hwo you are dealing with. I surely will not deal with pennradio .

Posted: Thu Aug 27, 2009 6:46 pm Post subject: Update, the stuff keeps on coming!In the case of the damaged power supply from above:

Paypal rendered a decision against Pennradio. I boxed the damaged power supply for return shipment very well and took photos of the packaging. Paypal assured me that once the seller received the returned PS I would be issued payment. I tracked the shipping and on the very day the item was received by him it was immediately re-listed. Not with new photos showing the damage, not with any mention of the damage. He simply used the same listing from the origianal sale , unchanged in the photos or description. Lucky Dave, the item sold for more the second time around. I felt some pity for the poor "winner" and pretty much shrugged it off.
Some time later I see the same power supply offered for sale from a ham not too far from my QTH. He of course disclosed the shortcomings and was under the impression that the damge was incurred en-route to him. I sent him a PM to make sure this was indeed the same power supply , It turned out as suspected, to be one and the same! He said that the seller offered to send him a A-54 Elmac transmitter pretty much when/if he could find it in exchange for positive feedback. The somewhat too trusting buyer complied . Of course the A-54 never materialized !
We discussed the damage in question and determined indeed it was the same damage that occured during the original shipment. Buyer number 2 at that point filed a claim with Paypal. They were wonderful and issued a FULL refund including the large number that Pennradio charged for shipping.

I got my money back and thanks to a little communication between hams buyer two got his money back.

Let me make a suggestion. Hire an attorney and sue this jerk for defamation. Drag him into court and all all of the folks that he has ripped off as witnesses. Then see if your local DA will look into his activities. Report him to ebay and see if they will ban him. In general, make his life a living hell in the courts.

Dennis, I don't know you from mud. Either your are engaging in the scams described, or you are the victim of a conspiracy that spans a lot of people who don't appear to even each other. I have seen internet scam artists defend their 'honor' with great vigor. Because of the faceless interface of the internet, they take advantage of people and can claim to be victims of their greedy and heartless customers.

Maybe you would care to explain to all of us how you have had such very bad reviews on the internet? Really, why would all of these folks feel the need to attack you? It has been alleged that you lie a lot. It has been alleged in this form that you misrepresented yourself as wanting to buy a piece of equipment for a church, when that was not true. That is called fraud in the inducement.

Internet scam artists usually have a lot of tax issues too. They don't pay local and state sales taxes, use taxes, or federal income taxes as a general rule. It's not uncommon for an audit to find serious faults. Jail time is often a consequence along with strict financial penalties.

You don't worry about that sort of thing, do you? After all, you are just an honest internet merchant who is being persecuted by a pack of rabid ham radio fanatics - right?

Someone said that you don't accept Paypal or credit cards; is that right? Those two things are very common indicators of internet scams. People who don't take Paypal or credit card don't do so because both provide their customers with a viable avenue of redress, or their past activities have disqualified them from using these payment methods.

I have to admit, Dennis, that it is not looking good for you. There are an awful lot of indicators that would steer a prudent internet customer from dealing with you. I know that I would not buy from you or sell to you.

4293. RE: [acom-list] Gossip & Slander: Paul Glassman W8JN

Yahoo group: acom-list (2010 — 2016)
Date: 2011-08-08 18:32:35 UTC
From: BMarton
Topic: 4184 Message: 4293

Well Said Pete!

As I mentioned earlier, all of this information is posted in the public domain and is available for anyone to read and review prior to making a decision as whether or not they send off funds for an item being offered. I see no harm in reading reprints of the reviews. It is no different than going to the local Better Business Bureau website to read reviews posted of a local merchant.

For voicing this opinion, I am replied to as "Brucie" by this guy, who I have never spoken to in my life. That in itself is indicative to me of who I would be dealing with in the event I wanted to make a purchase. He has an attitude and I don't particularly like to deal with people who have attitude; it usually leads to problems from what I have found in the past.

Bruce K1XR

Dennis, I don't know you from mud. Either your are engaging in the scams described, or you are the victim of a conspiracy that spans a lot of people who don't appear to even each other. I have seen internet scam artists defend their 'honor' with great vigor. Because of the faceless interface of the internet, they take advantage of people and can claim to be victims of their greedy and heartless customers.

Maybe you would care to explain to all of us how you have had such very bad reviews on the internet? Really, why would all of these folks feel the need to attack you? It has been alleged that you lie a lot. It has been alleged in this form that you misrepresented yourself as wanting to buy a piece of equipment for a church, when that was not true. That is called fraud in the inducement.

Internet scam artists usually have a lot of tax issues too. They don't pay local and state sales taxes, use taxes, or federal income taxes as a general rule. It's not uncommon for an audit to find serious faults. Jail time is often a consequence along with strict financial penalties.

You don't worry about that sort of thing, do you? After all, you are just an honest internet merchant who is being persecuted by a pack of rabid ham radio fanatics - right?

Someone said that you don't accept Paypal or credit cards; is that
right? Those two things are very common indicators of internet scams.
People who don't take Paypal or credit card don't do so because both
provide their customers with a viable avenue of redress, or their past
activities have disqualified them from using these payment methods.

I have to admit, Dennis, that it is not looking good for you. There are
an awful lot of indicators that would steer a prudent internet customer
from dealing with you. I know that I would not buy from you or sell to you.

Pete

While I don't have an axe to grind either way here, why is this being discussed on the Acom reflector at all?

Who is the moderator of this list anyway? I've been on the list virtually since it began that I'm aware of and I'm not sure who the moderator is.

I believe what started this thread was a guy offering up an amplifier for sale, which was not an Acom product.

Subject: Re: [acom-list] Gossip & Slander: Paul Glassman W8JN

Dennis, I don't know you from mud. Either your are engaging in the scams described, or you are the victim of a conspiracy that spans a lot of people who don't appear to even each other. I have seen internet scam artists defend their 'honor' with great vigor. Because of the faceless interface of the internet, they take advantage of people and can claim to be victims of their greedy and heartless customers.

Maybe you would care to explain to all of us how you have had such very bad reviews on the internet? Really, why would all of these folks feel the need to attack you? It has been alleged that you lie a lot. It has been alleged in this form that you misrepresented yourself as wanting to buy a piece of equipment for a church, when that was not true. That is called fraud in the inducement.

Internet scam artists usually have a lot of tax issues too. They don't pay local and state sales taxes, use taxes, or federal income taxes as a general rule. It's not uncommon for an audit to find serious faults. Jail time is often a consequence along with strict financial penalties.

You don't worry about that sort of thing, do you? After all, you are just an honest internet merchant who is being persecuted by a pack of rabid ham radio fanatics - right?

Someone said that you don't accept Paypal or credit cards; is that right? Those two things are very common indicators of internet scams. People who don't take Paypal or credit card don't do so because both provide their customers with a viable avenue of redress, or their past activities have disqualified them from using these payment methods.

I have to admit, Dennis, that it is not looking good for you. There are an awful lot of indicators that would steer a prudent internet customer from dealing with you. I know that I would not buy from you or sell to you.

Let me make a suggestion. Hire an attorney and sue this jerk for

defamation. Drag him into court and all all of the folks that he has

ripped off as witnesses. Then see if your local DA will look into his

activities. Report him to ebay and see if they will ban him. In general,

make his life a living hell in the courts.

4305. ACOM 1010

Yahoo group: acom-list (2010 — 2016)
Date: 2011-08-25 15:39:26 UTC
From: Tony Morris
Topic: 3809 Message: 4305

New ACOM 1010 tops out at 500W on the LED wattmeter during tuning with 70W input (RTTY button not activated). Additional power from transceivers (two different ones have the same effect) won't make it go any higher. It's rated for 500W continuous carrier but other users and the dealer indicate LED should go to 800W when tuning. Suggestions?

Tony,

You didn't say band or whether or not you're using 240V mains.
Interesting video:
http://www.youtube.com/watch?v=2IPhe2qwNx0

The GU74B tube can certainly do 800W, the power supply is the limiting
factor in the 1010.

I've had 10 years worth of amps using this tube. The GU74B does go flat
after some time and increasing drive just increases screen current
without any power increase. The effect is noticed first on the highest
frequency band.

The ACOM-1010 is a newer product but still may still use a NOS tube, so
your tube could be flat. The ad does say it uses a Svetlana tube soit
may not be a poor Q/C Russian tube.

I purchased a number of replacement GU74B's from a reputable dealer. It
took 3 tries (under warranty) till we got one which would put out 1000W
on the ACOM1000. One only put out 600 watts.

Using 240V. The tube is indeed a Svetlana
GU74B. I can get only 500W max on 20, 15 and
10. Nowhere NEAR the output shown in the
youtube video. Same results using an OMNI VII
transceiver and an ICOM IC-718. Dealer
indicates the ACOM was loaded without a problem
to 800W at the shop before shipment. Tony, WA8TM

Check to see that your transceivers auto-antenna tuner is turned off.

Antenna auto-tuner is turned off. SWR is 1.2:1
max. All equipment connected to a common
ground. No change in the results using ANT2
socket on the transceiver or linear. 240V wall
receptacle shows 120V on both of the hot wires
to the ACOM. Same problem when using an
ICOM//IC-718 transceiver in place of the
TenTec. Bob (W5OV) at Array Solutions is
pulling another 1010 out of the warehouse and
tomorrow morning we'll go through the tuning
process together, comparing results by phone.
It increasingly looks to me like something got
shaken up in transit since nothing he or I have
tried so far has made a bit of difference. But
still welcome ideas/suggestions. Tony, WA8TM

There could be an easy fix for you :-) Read on:

Make sure you
have the correct mains voltage settings set in the Acom 1010 PSU. I
explain: If the house mains voltage is in example 220v and the default
voltage setting in the Acom 1010 of 240v is used, you will have much
lower RF output!

I experienced exactly the same, my house's mains
is 217volt under 10 amp load while Acom 1010 PSU was set to 240v and I
got in the 550 watts output only, a value far from the advertised RF
power the unit should be able to deliver.

Downside of the Acom
1010 (the only one if you ask me, beside the missing 50MHz band
selection) is that you have to re-solder thick metal joints in the
PSU... In other words, do not exercise this too often. And use lead-free
solder!!!

Kees,

In Europe this may be an issue, but here in the USA, our electricity is very tightly regulated at 120v/240v.

There are some exceptions to this that may be related to a rural electric company perhaps providing lower voltage, but nearly 100% of USA homes are serviced with 120/240v service.

The problem here is one of not being familiar with tuning of an amplifier and from conversations with Tony, it appears to me that he is adjusting the amplifier at less than the maximum tuning position.

He purchased the amplifier from us and it exceeds 800w when tuned properly.

I am going to work with him via telephone today to see if we can get his difficulty in tuning resolved.

Thanks for your suggestion.

I'm a home builder by trade. It is not at all uncommon to have a branch circuit that is not capable of handling the load of high-draw equipment. This can be a big issue in older homes and on newer large homes where long branch circuit runs can induce considerable voltage drop. Sometimes an outlet will show that voltage is within specifications when you test it with a multi-meter. When you put it under a heavy load, it will suffer from severe voltage drop.

My radio shack has a dedicated 120v, 20 amp, single pole outlet using #10 conductors for the power supply and a 240v, 20 amp, double pole outlet using #10 conductors for the Acom 1010. The additional conductor capacity ensures that sufficient current will be available with almost zero voltage drop when under full load.

Bob - You are correct that most homes have reliable 120v/240v service. But as a home builder I can tell you that is not the case everywhere. In some communities the power service is grossly overloaded. While you might have the correct voltage most of the time, at peak demand times it can fall considerably below specs.

Even when the utility is providing power at the right voltage, improper wiring materials and techniques can reduce voltage at an outlet. I have seen overly long conductor runs and undersized conductors create high voltage loss many times.

I once saw a 240v outlet that a homeowner had created by pulling 120v from an outlet on the left leg of the power supply and another 120v conductor from the right leg. Both outlets were connected to other outlets in their respective branch circuits. Depending on what else was powered on these two 120v branch circuits the power readings fluctuated and neither showed the same voltage when tested against ground, not to mention that fact that the circuit used two separate breakers.

He destroyed the equipment that was hooked to that outlet when one breaker tripped and the other didn't.

Reduced voltage issues in homes is a bigger problem that most people know.

Pete,

While there are odd cases like those you cite, the vast majority of the installations we're talking about are those with a dedicated 240v line with its own 15A or 20A 2 pole breaker and properly sized wiring (14ga or 12ga respectively).

We cannot give advice based on the fact that someone might use improperly sized or overloaded wiring - we have to presume that they are doing things properly and according to code.

If they're not doing things properly and according to code, they're putting their equipment and their homes at risk.

That said, all Acom amplifiers are specified to work at +/- 10% of the line voltage (216 to 264 on the 240v tap) so in the USA, there is no reason to set any amplifier for any other line voltage than 240v that is used here in the USA - except in an extreme or unusual case. Setting it for 240v allows you to not be concerned about the line voltage at all. The power companies in the US are required to maintain the line voltage within a smaller percentage of 240v than the amp is specified at, so as long as it is in the range of 216 to 264, your amp should be on the 240v tap.

If the electricity coming into the home is not close to 240v, a call should be made to the power company to report it.

In addition, even at full output on 240v, these amplifiers won't be drawing 10 amps, so there should be no issue with voltage drop. If there is, that is an indication that there is a problem elsewhere in the electrical system.

Bob - You are correct that most homes have reliable 120v/240v service. But as a home builder I can tell you that is not the case everywhere. In some communities the power service is grossly overloaded. While you might have the correct voltage most of the time, at peak demand times it

can fall considerably below specs.

Even when the utility is providing power at the right voltage, improper wiring materials and techniques can reduce voltage at an outlet. I have seen overly long conductor runs and undersized conductors create high voltage loss many times.

I once saw a 240v outlet that a homeowner had created by pulling 120v from an outlet on the left leg of the power supply and another 120v conductor from the right leg. Both outlets were connected to other outlets in their respective branch circuits. Depending on what else was powered on these two 120v branch circuits the power readings fluctuated and neither showed the same voltage when tested against ground, not to mention that fact that the circuit used two separate breakers.

He destroyed the equipment that was hooked to that outlet when one breaker tripped and the other didn't.

Reduced voltage issues in homes is a bigger problem that most people know.

Pete - KD4CQZ

Kees,

In Europe this may be an issue, but here in the USA, our electricity is very tightly regulated at 120v/240v.

There are some exceptions to this that may be related to a rural electric company perhaps providing lower voltage, but nearly 100% of USA homes are serviced with 120/240v service.

The problem here is one of not being familiar with tuning of an amplifier and from conversations with Tony, it appears to me that he is adjusting the amplifier at less than the maximum tuning position.

He purchased the amplifier from us and it exceeds 800w when tuned properly.

I am going to work with him via telephone today to see if we can get his difficulty in tuning resolved.

Thanks for your suggestion.

There could be an easy fix for you :-) Read on:

Make sure you
have the correct mains voltage settings set in the Acom 1010 PSU. I explain: If the house mains voltage is in example 220v and the default voltage setting in the Acom 1010 of 240v is used, you will have much lower RF output!

I experienced exactly the same, my house's mains is 217volt under 10 amp load while Acom 1010 PSU was set to 240v and I got in the 550 watts output only, a value far from the advertised RF power the unit should be able to deliver.

Downside of the Acom
1010 (the only one if you ask me, beside the missing 50MHz band selection) is that you have to re-solder thick metal joints in the PSU... In other words, do not exercise this too often. And use lead-free solder!!!

My mains voltage unloaded is currently 219-220v max. It drops 2 volt under 10 amp load. It costed me a lot of effort to get to this situation, by the means of replacing all wires by much thicker diameter wires, create separate mains groups, install fuses, over-voltage protectors and huge 40amp mains filters etc. The shack main 'group' is totally separated from anything else in the house and solely feeds the shack equipment. Anything else like lights and PCs are wired on one of the two other mains groups in the house.

We were told years ago the mains will be raised to 240v, well that is not 'the case' in my case hi hi.

Subject: RE: [acom-list] ACOM 1010

Pete,

While there are odd cases like those you cite, the vast majority of the

installations we're talking about are those with a dedicated 240v line with

its own 15A or 20A 2 pole breaker and properly sized wiring (14ga or 12ga

respectively).

We cannot give advice based on the fact that someone might use improperly

sized or overloaded wiring - we have to presume that they are doing things

properly and according to code.

If they're not doing things properly and according to code, they're putting

their equipment and their homes at risk.

That said, all Acom amplifiers are specified to work at +/- 10% of the line

voltage (216 to 264 on the 240v tap) so in the USA, there is no reason to

set any amplifier for any other line voltage than 240v that is used here in

the USA - except in an extreme or unusual case. Setting it for 240v allows

you to not be concerned about the line voltage at all. The power companies

in the US are required to maintain the line voltage within a smaller

percentage of 240v than the amp is specified at, so as long as it is in the

range of 216 to 264, your amp should be on the 240v tap.

If the electricity coming into the home is not close to 240v, a call should

be made to the power company to report it.

In addition, even at full output on 240v, these amplifiers won't be drawing 10 amps, so there should be no issue with voltage drop. If there is, that is an indication that there is a problem elsewhere in the electrical system.

Hello everyone,
I own a Acom 1010 and the output power has always been excellent.
For some time the electricity distribution network has updated its systems with the result of having a first voltage from 230/235V to 220V now. The Acom 1010 hours delivers less power than before.
I want to change the voltage selector is set to 230 now and would like to configure it for 220V.
Since I have never performed this procedure, some of you could kindly provide me with detailed instructions to proceed to work?

Thanks for your help!

4320. ACOM Director

Yahoo group: acom-list (2010 — 2016)
Date: 2011-08-29 09:58:39 UTC
From: James Thresher
Topic: 4320 Message: 4320

Hi All,

Due to work commitments I'm not getting a lot of time to work on the ACOM Director project, because of this I'm considering making the project open source and hosting it on codeplex (http://www.codeplex.com/) so that others can contribute towards the project and make use of the source code.

Is this something that any of you would be interested in? Are there any programmers among the ACOM2000 users who may wish to help to move the project forward?

4321. Lantronix Serial Server with 2000a

Yahoo group: acom-list (2010 — 2016)
Date: 2011-08-29 14:04:35 UTC
From: dj0qn
Topic: 4321 Message: 4321

I have installed a Lantronix serial server (UDS2100) along with the Acom remote power-on adapter to remote control the 2000a.

There is a strange problem that I don't experience running off of a local (real) serial port for an identical 2000a in another station:

This particular 2000a turns on as soon as the remote software (Acom Tools, TRX-Acom, etc.) that is used connects to the remote serial port, not waiting for the software command first. In addition, it turns itself off without the cool down phase if the remote software is disconnected first.

Perhaps someone else has this configuration running and can let me know if something is set wrong in either the Acom menu, or (more likely) either the Lantronix CPR manager or in the UDS2100 itself.

Hi all,
I´m keeping this message on my Acom 2000´s RCU everytime I try to key the amp on. I´m assuming that the vacuum relay has definitively gone (yes, it failed from time to time before).
I talked to Acom and was tempted to send the amplifier to their technical service but the unit is quite heavy and delicate and I´m concerned about the shipping company. I got a friend who
has changed some relays on the Acom 1000 series and got an enough good reputation to let him play inside my well cared unit (ha!). I´m wondering if there is any source in Europe to buy
the 2000´s vacuum relays and if it´s advisable to replace both relays. On the other hand, I would be pleased to hear any other recomendation you could give me. Thank you!
BTW: I´m keeping my QRO capabilities by bringing back to life my old and trusty Drake L7....it has never let me down !!!...73

Acom Bulgaria stocks tubes also.

The price is high, but they have them.

Hi Peter,
Thanks for the info. I tried Acom but factory must be closed till September, the 1st, however I can wait. TU. 73

Hi all,
I´m keeping this message on my Acom 2000´s RCU everytime I try to key the amp on. I´m assuming that the vacuum relay has definitively gone (yes, it failed from time to time before).
I talked to Acom and was tempted to send the amplifier to their technical service but the unit is quite heavy and delicate and I´m concerned about the shipping company. I got a friend who
has changed some relays on the Acom 1000 series and got an enough good reputation to let him play inside my well cared unit (ha!). I´m wondering if there is any source in Europe to buy
the 2000´s vacuum relays and if it´s advisable to replace both relays.. On the other hand, I would be pleased to hear any other recomendation you could give me. Thank you!
BTW: I´m keeping my QRO capabilities by bringing back to life my old and trusty Drake L7....it has never let me down !!!...73

Good idea James.

I understand it takes time and effort supporting any product, specially a free one.

Thanks for the efforts.

Subject: [acom-list] ACOM Director

Hi All,

Due to work commitments I'm not getting a lot of time to work on the ACOM Director project, because of this I'm considering making the project open source and hosting it on codeplex (http://www.codeplex.com/) so that others can contribute towards the project and make use of the source code.

Is this something that any of you would be interested in? Are there any programmers among the ACOM2000 users who may wish to help to move the project forward?

Hi James,

I wrote some of the original Acom control software many years ago... Yes, completely understand time commitments... I have many of those constraints myself.
I'm a .Net guy... glad to keep and eye on the project and enhance or bug fix. I'll be looking for it on codeplex.

Thanks for the great work!

Hi,
I have had this _("Antenna relay open it should be close....."_) problem in the past time october 2010 this error was produced for one of my antennas (I do not detect before if the problem is produced for any antenna all antennas are OK) with others not appear, I ask for it ACOM Bulgaria, and say to my step to step to take measure in the internal plate all measures are OK (¿?) I think my antenna switch is damage (¿?) I check all antenna conections and swich,finally I decide to change the vacuun realy and ask for the price, but at this time I decide to make a experiment (!!!!!!!!!!!)
I build a RF choke 23,5 turns of RG 58/U (you ca make it of RG 213, but is very long the pipe) on a 110 mm diameter PVC pipe and insert THE CHOKE "between" _antenna out and antenna the switch_ the problem has not appeared at the moment and the ACOM 2000 is working 100%
I am surprised for it (¿?), mine is one of the 2000/2001 _year is 10 years old .

Interesting !
Could it be that the protective choke across the amp output is open circuit ?
The amp should have a choke providing a DC path from output to ground.
If this choke is placed after the output relay the amp could be using this path as a check for relay closure. Just an idea... but if so is the case a choke failure would indicate an open relay....
I will check the schematics later and see...

Hola Ivan,
Gracias por responder. Dudo que sea eso que dices porque todo va perfecto con 1 Kw del Drake L7. No obstante, voy a hechar un ojo a mi conmutador de antenas.
Gracias !

Thanks for the reply. I doubt that could be my problem as it started to appear after a heavy duty keying cycle during the ST0R cw´s pile. No, I don´t do QSK but the pile up was huge !!!!
However, I´m gonna climb the tower to check the antenna switch. Thank you !!...73

Just my 2cents:

I have purchased in the past several parts for various Acom amps (repairs) by Acom in Bulgaria. All parts were delivered against normal shop prices (sometimes even lower!) and lighting fast delivery.

Seriously, I wish that other amp manufacturers did the same...

SOLUTION: Apparently the original tube was damaged on transit. New tube works fine. Bob at Array Solutions dedicated far more time to solving this frustrating problem than I had any reason to expect. Excellent customer service.

4333. ACOM Director

Yahoo group: acom-list (2010 — 2016)
Date: 2011-09-05 07:05:07 UTC
From: James Thresher
Topic: 4320 Message: 4333

Further to my email the other week, ACOM Director is now available on codeplex as an open source project.

I will be continuing to develop the software, but progress may be a bit slower due to work commitments (we all have to pay the bills after all).

However by creating the codeplex project, it opens up the possibility of others contributing towards the project as well.

If anyone would like to be able to work on the project, either programming or documentation etc. then drop me an email and I'll get a user setup for you.

The project can be found at http://acomdirector.codeplex.com , If anyone is curious, the source code is fully available for anyone to browse and download.

My amp is intermittently reporting "Relay closed should be open" failures in receive mode. I can sometimes hear the TR relay chattering.

I've sent an email to Will based on an email address I found with no response. The Acom site currently seems to have no contact info, in fact, no content at all other than the root page and 1010 link.

I am concerned that it isn't easier to reach someone. What is the correct method to obtain support?

Hi Hans,

The date stamp is printed on the tube itself on the middle ring. In general the newer tubes are nice & shiny, the tubes produced before let say year 1998 or so are looking 'dull'.

Send me some good quality photos of the stamped numbers/characters on the tube via email (callsign @ hotmail dot com) and I tell you the date in return.

Hello Hans,

You will find a little stamp on the tube, e.g. 1192 means: November 1992.

It's on the same ring as the other text, e.g. ry-74b9207 OTK 10 <russian letters> etc.

4340. ACOM 200A Failure (T/R relay)

Yahoo group: acom-list (2010 — 2016)
Date: 2011-09-13 12:18:39 UTC
From: Jay Terleski
Topic: 4340 Message: 4340

Drew,

ACOM applies a 1.8VDC on the TR relay through an RF choke. It is used to sense which position the TR relay is in.
Check your schematics. The voltage is sent to the Processor board. It is highly likely you need to just change out the TR relay. HC-1 is a good choice. and you can get new ones from Allen Bond at Max Gain Systems, best prices I have found.

Hi Jay and all,
This happens to me a month ago. Got the same message ¨antenna relay open it should be close¨..It was displayed twice or three times during a hard cw pileup. Switching the amp to standby for a few seconds and then back on solved the problem ocasionally. On the next day the relay went off definitively. I was pretty sure about a relay failure so I ordered a Gigavac GH1 relay directly from Acom. It tooks 4 days to be here. Meanwhile I have unplugged the amp and had the top cover and the front cover removed. The relay is clearly visible from the front, down in the left side. All that you would need is a good solder and a medium soldering skills. Took me 5 minutes to replace the relay, even less time than putting the top cover and the front cover back in place. The amp is working great since then but I´m trying to find out why the relay failed as I dont think anything related to a hot switching. Ideas are welcome. Best 73!

Drew,

ACOM applies a 1.8VDC on the TR relay through an RF choke. It is used to
sense which position the TR relay is in.
Check your schematics. The voltage is sent to the Processor board. It is
highly likely you need to just change out the TR relay. HC-1 is a good
choice. and you can get new ones from Allen Bond at Max Gain Systems, best
prices I have found.

Jay

Fernando,

Relays have a finite number of operations they are rated for.
If you're doing QSK CW consider the following:

25 contests with 1000 QSO's adds up to >1,000,000 operations.

HC-1 relays are rated for 2 million operations.

Kevin beat me to it..

Relays have a moving part and contacts that brush against each other, hence they wear out. It's not uncommon to call 7,000 CQs in heavy contesting over a 48 hour period. 6/min X 60 min X 48 hours = 8640. That's not counting QSOs - double it at least to 15,000 per 48 hour contest. That's also not counting QSK - this is the number with QSK off.

For a 2 million cycle rated relay, that's 133, 48 hour contests. With QSK on it's literally only a few contests. Most of the HC-1s last way over 2 million cycles, but then there are the premature failures. Both my 2000As have never lost a relay - the amps are at around 10,000 hours and the relays are WAY past their spec life. I had an HC-1 go bad in an Alpha 99 however after about a year. It's a moving mechanical part...ya never know.

MAXGAIN is the best place for replacements.Ill second Jay's recommendation.. Alan carries new ones and used ones. I'd pop for a new one. Easy to swap out..

The relay in my 2000A failed a few years ago. In replacing the relay, I found one of the relay coil pins was loose in the housing. I touched the pin and it fell out of the housing. I suspect the relay contacts were ok, the coil was not making a good connection. When replacing the relay make sure to use minimum heat on the relay contact pins.

If I were into contesting, I would keep a new spare GH-1 ready in the parts bin. Despite some early vacuum relay failures, I would resist replacement with the newer wave of high-performance frame relays, (e.g., Tyco/Shrak RTB14012) even though many are now specified to operate at more than 10 million operations, are dirt cheap, and otherwise offer good HF performance.

4352. Help - Arc Fault error

Yahoo group: acom-list (2010 — 2016)
Date: 2011-09-13 16:58:34 UTC
From: Mark Mumaw
Topic: 4340 Message: 4352

I keep getting Arc Fault errors with my Acom 2000A. I had always thought it was from spikes from the exciter but I am getting them from a rig that is only capable of 20 Watts PEP output. It faults even with a max output of 800 watts into several different antennas.

Several months ago, I had one tube developed gird to screen leakage which I replaced with a new tube. The original tubes only had 100-200 hours of use.

Any ideas???

Thanks...Mark NU6X Sedona, AZ

Topic: 4340 Message: 4353

While we are kicking around the T/R relay issues - the important points for a swap out are:

1. Keep the heat to a minimum on the pins (already mentioned)
2. Do not over-tighten the retaining nut. The nut is a special part, as is the lock-washer than goes with it. If you get a 'new' relay that does not have a nut and washer use the ones off your old relay. Tighter than finger tight, but not a whole lot more... The spec sheet probably has a torque rating..

Arc faults are most often caused by problems in the antenna or feedlines. I'd start there.

From: Ron Castro
Topic: 4340 Message: 4355

Mark:

A few months ago when I started having the same problem, I examined the circuit that causes an Arc Fault error to trigger and found that low frequency energy is what makes it trigger. Some early 'fixes' found on the internet included changing a capacitor in the circuit to make it less sensitive, and installing a high-pass filter between the exciter and the amplifier, especially when using radios with a history of low frequency "thumps" like the Ten Tec Orions. In my case, an ICE broadcast band filter fixed the problem. I had one in for a long time, but took it out for a while and found that during CW or RTTY contests the problem returned. Replacing it cured the problem.

Assuming there is no actual arcing in your amplifier, antenna or transmission line, including any lightning protector you might be using, low frequency emissions from the exciter is most likely the problem.

Been using a FT1000MP MKV field feeding the ACOM for the last 5 years...Before the ACOM I had a Drake L7 (still using). Never had a problem with the Drake in many years...The Acom is keying directly from the radio. I mean I don´t have any buffer relay between them....The Acom is 2 years old and it has about 4000 hours. I´m also owning a MicroKeyer and I know it has a relay inside to feed amplifiers. It can be configurate in miliseconds for a bigger delay. That would prevent hot switchings. I´m still dealing with the MicroKeyer´s manual...I have already connected the wires but the setup menu is getting me crazy. 73 and thanks for the ideas

Mark - my Arc Fault errors were caused by water inside my lightning arrestor (MFJ-272) located in-line with my coax outside the shack. It took a while to find the culprit because my Ameritron AL-80 amp worked fine on the same coax and my antenna analyzer (MFJ259) gave SWR readings that were OK. I agree with Neil. I would check first for feedline connector problems with moisture, especially if the antenna appears OK.

Mark,
I have gotten that error on a occasion. The manual seems to imply that is problem on the antenna side of the amp. The last time I got the error on the low end of 40M where my SWR is about 2.8:1 I check all my connectors in the shack and hand tightened one or two that were loose and I haven't seen the problem again. Once I got the problem and the "Proc" light was on, but the amp had not even tripped off and continued to work. I reset the amp and continued on with the QSO. Check your connections, switches and tuner to see if anything may have arced or if lightning has gotten your system.
Good luck.
73,
George

Subject: [acom-list] Help - Arc Fault error

I keep getting Arc Fault errors with my Acom 2000A. I had always thought it was from spikes from the exciter but I am getting them from a rig that is only capable of 20 Watts PEP output. It faults even with a max output of 800 watts into several different antennas.

Several months ago, I had one tube developed gird to screen leakage which I replaced with a new tube. The original tubes only had 100-200 hours of use.

Any ideas???

Thanks...Mark NU6X Sedona, AZ

Hans & Kees,

I can't find the separate numbers on the tube but i send Kees de pictures.

Thanks anyway !

Hans

I'd like to piggy back on this thread and get your thoughts on why my Acom 2000A Arc Faults only when I take my Flex 5000A transceiver *OUT *of tune. That is in about 2 out of 20 times, if the amp is in operate, and I press TUNE, then it will ARC fault when I exit TUNE. Tune power (exciter) is 10W. It never ARC faults otherwise.

Yes, I know I should try it with another rig but haven't done so yet. I'm most interested if anyone else has seen this behavior or knows of a fix.

Your thoughts gratefully appreciated.

This sounds similar to the low frequency "thump" problem the Ten Tec Orion transceivers have with the 2000A, which tended to happen on 'key up' following a 'key down' during CW or RTTY. I put an ICE 402X BCB filter between the radio and the amplifier and that seemed to fix the problem.

Have not experienced a fault as you mentioned when taking
the 5000A "out" of tune.
The ACOM here works fine with 1500, 3000 and 5000A.

Person looking for a solution to a Acom Amplifier problem.....May I make a suggestion that you call up ARRAY SOLUTIONS in Texas for ALL Acom Amplifier repairs and problems. They are fast, direct and nicely priced. Above all, ARRAY SOLUTIONS indeed know the amplifier. Ask for BOB.....

John,

Thanks for the nudge. Sure enough, their site is not compatible with IE9. Went into compatibility mode and pop, there they are.

I had Will's email correct, but he isn't answering. But, Jay at Array Solutions was very helpful.

4372. Re: Acom 1000 Firmware

Yahoo group: acom-list (2010 — 2016)
Date: 2011-09-26 03:43:52 UTC
From: Andrey
Topic: 4371 Message: 4372

The firmware is programmed on a "classic" EPROM - 27C512 chip. The only way to upgrade it is to get the HEX/BIN file for a newer version from ACOM, erase the original chip with UV light (or just get a blank chip) and use an EPROM programmer to write the file. The firmware IC is socketed on the control board behind the front panel.
The ACOM 1000 MCU is not designed around a modern PIC with user-friendly means of flashing the firmware via USB or serial port. Updates (when really needed) are normally done by their service facilities.

Hope this helps!

Hi all
I monitored tube temps during CQ WW RTTY contest.
My output power was 800W and temp's raised to 90C when I was running.

I have extra fan installed (12V) but it never started to spin.
I connected fan into extra 12V power supply and let it spin on half speed.
Temps decreased to 70C, is there design flaw in this amp or are those temps normal?

It would be better if extra fan speed depends on tube temp.

Hello Tomi

Check your fan installation, on my amp the external fan spins as soon the amp is powered up and ready for operation. When temperature exceeds 80 degrees, the external fan begins to turn much faster, you will hear the noise of the fans. After a short time the temperature cools down and the fans are spinning slower again. Check your external fan for the correct spinning direction, it should act as a blower and not as a sucker!

Thanks Mark.

Perhaps I have something wrong with the wirings inside the amp.
Fan is ok because it works when I take 12V from my power supply.
Still I wonder are my temp readings ok for 800W.

Hello Tomi

I think the temps are ok, it's always a little depending on the environmental temperature, but I have more or less the same readings.

btw: remoterig in sweden will offer a perfect web-control for the acom2000 soon, the beta is under test and working very stable and flawlessy. You can even do an auto tuning process and switching the antenna, reading the amp parameters. the switch has a power and swr-display and shows the led's of the remote-control.

What problem are you looking to resolve with your 1000 through a change of firmware?

-----Original Message-----

To: acom-list@yahoogroups.com
Subject: [acom-list] Re: Acom 1000 Firmware

The firmware is programmed on a "classic" EPROM - 27C512 chip. The only way to upgrade it is to get the HEX/BIN file for a newer version from ACOM, erase the original chip with UV light (or just get a blank chip) and use an EPROM programmer to write the file. The firmware IC is socketed on the control board behind the front panel.
The ACOM 1000 MCU is not designed around a modern PIC with user-friendly means of flashing the firmware via USB or serial port. Updates (when really needed) are normally done by their service facilities.

Hope this helps!

Hello Mark,

very interesting thread,
sorry to be off-topic .. but would you kindly explain more in details about
your remote rig ?
Are you talking about Acom director ?
Regarding the supplemental fun, i discovered that my Acom 2000A is equipped
with it, but it has never turned it on.
Are we sure that exceeding the 80 degrees the fun will be operational ? I
will try to "force" that limit and see if my fan will begin spinning ;-)

Thanks.

Hello Fulvio

The Acom remote control is based on the webswitch provided by remoterig. At the moment it's a simple software mod of the existing web-switch, in future there will be a new hardware plattform with two relays only. The Web switch has to be connected via RS232-Port with the amp. You can use 2 Relais of the webswitch, one for the main power on/off, the other switches the amp on and off. This is done by a simple bridging of two pins in the remote control connector, very simple. The soft on the webswitch gives you complete control over the amp, you can switch antennas when using the acom-antenna-switch and even do an auto-tuning to adapt your amp at changed environmental conditions. Another buttom reads all the parameters of the amp and shows them in a popup-window. A Pc with a simple browser is used at the control site, no other software, no pc at the remote. The new product should be available soon, I had the opportunity to participate at the beta test and suggest some important features for the soft.

To top the joy, there is also a switch for remoting the steppIR under test. The two new products where shown at the USKA-Meeting last weekend in Lucerne.

The behaviour of the external fan could depend on the age of the amp. It's possible that earlier models start the fan only, when temperature exceeds a certain limit. At my newer Acom the fan turns permanently, I'm very sure about that, hit it with my fingers when searching a connector at the back of the amp:-) I did the testing also heating up the amp to 80 or 90 degrees, it's some time ago, but I think the temp-limit was 80 degrees, then you hear the fans speeding up and temperature comes down again rapidly.

Hi

During a few contests I experience this alarm "Hot Switching" due enable the PTT of the Acom 1000 wired from PTT of my microham keyer box.

I tried to change the delay time etc. to prevent there is power out to PA before relay switches?

Anyone have idea?

It can also be RF from other Transmitter in Multi operation, but it also happens when no other TX are transmitting.

Hi Markus,

Do you know if MicroBit made use of the ACOM Director source code I sent you in the end? It sounds like quite a nice solution they are developing.
Especially as it□s a hardware interface.

Hi James

They developped the software on another plattform, so I don't know how useful the source code was for them, but anyway, the info about the antenna switching command was very helpful for them. Thanks a lot for your support, the switch is running fine, still perfectioning some features, but the soft is very stable and it seems to be a better plattform compared to ifty-nifty pc's with their 1000 ways to crash and to produce hang-ups. I never had to reset the switch until now. At the moment, a manual switching of the band segments is under study, this gives a good addition to the already working manual switching of the antennas. So you can run the amp neither fully automatic or for special operating needs by manual switching of the antenna/band segment (eg. when operating auto tuners...). The advantage of this solution is the fact that you don't need a pc at the remote site, this solves a lot of maintenance problems. If you are interested in further details just have a look at www.remoterig.com.

Subject: AW: [acom-list] Re: ACOM 2000 tube temperatures on RTTY contest

Hello Fulvio

The Acom remote control is based on the webswitch provided by remoterig. At the moment it's a simple software mod of the existing web-switch, in future there will be a new hardware plattform with two relays only. The Web switch has to be connected via RS232-Port with the amp. You can use 2 Relais of the webswitch, one for the main power on/off, the other switches the amp on and off. This is done by a simple bridging of two pins in the remote control connector, very simple. The soft on the webswitch gives you complete control

over the amp, you can switch antennas when using the acom-antenna-switch and even do an auto-tuning to adapt your amp at changed environmental conditions. Another buttom reads all the parameters of the amp and shows them in a popup-window. A Pc with a simple browser is used at the control site, no other software, no pc at the remote. The new product should be available soon, I had the opportunity to participate at the beta test and suggest some important features for the soft.

To top the joy, there is also a switch for remoting the steppIR under test. The two new products where shown at the USKA-Meeting last weekend in Lucerne.

The behaviour of the external fan could depend on the age of the amp. It's possible that earlier models start the fan only, when temperature exceeds a certain limit. At my newer Acom the fan turns permanently, I'm very sure about that, hit it with my fingers when searching a connector at the back of the amp:-) I did the testing also heating up the amp to 80 or 90 degrees, it's some time ago, but I think the temp-limit was 80 degrees, then you hear the fans speeding up and temperature comes down again rapidly.

Hi Markus,

That is the problem with PC based solutions, Even if the software you□re running is 100% bug free (which of course it never is) there are still so many other things that can cause the PC to crash that you can never really reach the same level of stability as firmware running on a micro.

For an Acom 2000A that was produced more than 10 years ago, would it
make sense to do a firmware upgrade? Would the new firmware support the
old hardware support?

On 9/25/2011 11:43 PM, Andrey wrote:
> The firmware is programmed on a "classic" EPROM - 27C512 chip. The only way to upgrade it is to get the HEX/BIN file for a newer version from ACOM, erase the original chip with UV light (or just get a blank chip) and use an EPROM programmer to write the file. The firmware IC is socketed on the control board behind the front panel.

The short answer is no.

Generally, the firmware changes do not "fix" anything. They instead are related to making changes associated with different components being used over the years as availability of specific components has changed.

So, if you would ask Acom to provide updated firmware for your amplifier, they would ask what the serial number is, and in most cases, they would give you a new chip containing the same "old" firmware you already have. There might be exceptions to this somewhere along the line, but this is generally true.

Unless you're having a specific issue where your amplifier is malfunctioning, there is no reason to think about changing the firmware in your amplifier.

Hello Mark,

thanks for sharing these great news !
Very useful. I'm not yet interesting in remoting my amplifier .. but let's see in the near future.
Actually i'm using my MK2R+ wired to 2 Sation Masters from Microham. Locally, the automation works like a charm and I had no problems driving my Acom2000A with the original MK cables.
I was testing the Acom Director which is also working great (I'm one of the many beta tester).
What is was very interesting to me .. is the main power ON/OFF feature that webswitch/remote rig has.
Feel free to post good news in the future ;-)

> To top the joy, there is also a switch for remoting the steppIR under test. The two new products where shown at the USKA-Meeting last weekend in Lucerne.

At my newer Acom the fan turns permanently, I'm very sure about that, hit it with my fingers when searching a connector at the back of the amp:-) I did the testing also heating up the amp to 80 or 90 degrees, it's some time ago, but I think the temp-limit was 80 degrees, then you hear the fans speeding up and temperature comes down again rapidly.
>

My Acom 2000A is about 2 years old but I will run the test just to be sure it works.
Bought from Vinecom.co.uk with a very GOOD price ;-)

4388. Acom 2000A Internal Blower

Yahoo group: acom-list (2010 — 2016)
Date: 2011-09-26 17:18:52 UTC
From: Ron NØAT
Topic: 4371 Message: 4388

The internal fan (blower) in my 2000A didn☐t sound quite right the past few months. I seemed to rattle a bit. At times it delayed starting up when turning on the 2000A power, but it started before the warm-up expired.

For the past two tries, the fan didn☐t start up at all. I immediately shut down the amplifier after the warm up period expired as I think it might harm the tubes without the blower running.

So today I took the cover off and oiled the blower motor. It☐s somewhat difficult to get oil to the motor shaft, especially the back side. Now the blower starts up ok. But I☐m worried I might have used the improper oil. I used Pflueger Speede Oil. Maybe this is not the correct lubricant.

Any suggestions for the correct lubricant for the blower motor?

Hi Bob,

Was dreaming that new firmware might provide things like improved
operating parameters and new tuning algorithms that run 3 times as fast!
But, I also knew I was dreaming.

4390. ICOM - ACOM 2000A QSK

Yahoo group: acom-list (2010 — 2016)
Date: 2011-09-26 20:02:46 UTC
From: Ralph
Topic: 4390 Message: 4390

Hi all,
I am trying to determine the correct wiring and settings for full QSK between my IC-7700 and Acom 2000A. I am using one of the new Microham Digi-Keyer II interfaces with the K1EL keyer built into the DK-II. The IC-7700 is connected directly to the ACOM Key-In. I have tried numerous settings on the DK-II but it still does not sound right. I can the hear the changes but it still seems very choppy on receive. My former PW-1 was perfect on the receive end with QSK.

Present settings on the DK-II are:
PTT Selector: CW QSK
PA PTT Tail: 0ms
PTT Lead: 0ms
PTT Tail: (Constant) 20ms

These settings sounded best to me but still are choppy. Any ideas would be appreciated.

Most of you are aware of the ACOM Director software I produced for the ACOM 2000A, in response to this I've had a number of requests recently about control software for the ACOM2000S/SW (without it being connected to the ACOM2000A)

Unfortunately I don't own these so I'm wondering if there are any UK based Hams on here that have the ACOM2000S/SW combination who may be willing to loan these out in order to try to produce the control software for them (Assuming it turns out to be possible of course)? It would at most be a couple of weeks of work.

Any software produced would of course be open source and made available for free.

Hello James

What I can tell you about the operation of the ACOM2000S without amplifier is the following: switch and amp have the same command sets, just the device addresses are different. We are connecting the serial interface of our webswitch to the PC-Input of the A2000S-Controller and put the slide switch on the back-panel to position "PC". This switches the RX-data line of the controller from the amp to the external command device, eg. pc or webswitch. In our case it was necessary to repeat all the commands sent from the amp and the A2000S by the webswitch to synchronize the three boxes. Before doing that, we had very sloppy feedbacks from the amp, we had to wait for more than 30 seconds until we received a feedback by the amp.
Hope that helps for the further development!

This would be a problem - you'd be mis-tuning the amp to deliver less power and dissipating what should be going out and creating a great deal of heat. Your tubes would bear the brunt of this along with other components.

Reduce the drive if you don't want to run 1500 out and leave the amp alone.

My question assumes that you do not
change the tuning or loading controls manually!
Just lower the drive.

Hello All,

I am wondering if there is any negative issue
in running the 2000A at 700 or 800 watts by
just turning down the drive from the exciter??

Thanks in advance for any info....

There sure is another way.

You can readjust the loading after you
lower the drive!!

I am wondering if you just lower the drive without
readjusting the loading would there be any problems??

If you were to run full drive, and mis-tune the amp to lower the output,
that power has to be going somewhere. Doing this would damage your
amplifier. Don't do it.

Just reduce your drive.

Ted,

This is an entirely acceptable method of controlling power output. The only down-side might be that the amp won't be operating in its sweet spot for efficiency.

But, I highly recommend you adopt this practice, particularly when you are in the same pile-up as me.

You are missing my point completely!!!!

You are correct in mis-tuning the amp to reduce power is a no no but
I am not saying that!!!

I am saying is it necessary to readjust the tuning and loading
AFTER YOU LOWER THE DRIVE???

Will the tubes be operating at peek "efficiency" at lower drive
settings???

The basic amp tuning is done at very low power, anyway. And then its
still tuned right when you push it to full power with full exciter drive.

Will they be operating at peak efficiency at that power output if you just reduce the drive? Perhaps not, but since you're operating at less than full output, it doesn't matter. There's no stress or strain on anything since your well below rated output.

Bottom line is that it doesn't matter.

What is causing you to be concerned with this?

As I said, just reduce your drive and forget about it.

Ted,
If you're working SSB, you do this all the time-- dynamically.

Hi Jim,

Interesting! I didn't think about tuning being done at
low power levels!!

Many Thanks for the input..

The reason for my question is when operating RTTY I think it
would be wise to reduce drive power to the 2000A.

But as for CW or SSB I will be in the pile-ups with full power. Hi...

Yahoo group: acom-list (2010 — 2016)
Date: 2011-09-27 20:22:32 UTC
From: Ron NØAT
Topic: 4394 Message: 4409

This is what I received from Acom back in 2004:

☐You can tell Ron that generating much heat is normal for a linear when used below 70% of its nominal output (150W is 7.5% from 2000W).

The heat for RTTY mode would be reduced if you make a "HIGH" selection in the "DEF" (Defaults) sub-menu for "MAINS VOLTAGE / LOW-NORMAL-HIGH" settings and then refresh the AUTO TUNE like this is described in sections S.5-6 and S.4-1 of the Operating Manual.

Such a selection will make the AUTO TUNE to adjust the output tank for a 10% higher plate-loading resistance than it is with the NORMAL selection. This will reduce the maximum attainable output power but it will improve the plate efficiency. Also, the drive needed from the transceiver will be reduced which is an advantage for RTTY mode.

Besides, I would not recommend using ACOM2000A at an output less than 800-1000W output since the tubes regime is with a high idling current for good linearity. There is no special CW/FM mode foreseen.☐

4411. RE: [acom-list] Power out question??

Yahoo group: acom-list (2010 — 2016)
Date: 2011-09-28 01:52:17 UTC
From: Ron NØAT
Topic: 4394 Message: 4411

My question was regarding running the 2000A at 150 watts output. I was concerned about operating the amplifier so far out of normal specified operation. Will the amplifier generate excess heat when operated in this way? Is there a low power mode, like we have in the 1010?

Why would anyone want to run the 2000A at only 150 watts output? I was preparing to operate the ARRL RTTY Roundup contest in the low power category. Most contest sponsors define low power as 100 watts, while the ARRL defines low power as 150 watts. So rather than run my transceiver at 100 watts maximum and listen to the fans scream all weekend, I was looking into running my transceiver at 10 watts, and have the amplifier loaf along at 150 watts (maximum for the low power category).

After receiving the reply from Acom, I decided to leave the amplifier off and I ran my exciter at 100 watts.

The heat for RTTY mode would be reduced if you make a "HIGH" selection in the "DEF" (Defaults) sub-menu for "MAINS VOLTAGE / LOW-NORMAL-HIGH" settings and then refresh the AUTO TUNE like this is described in sections S.5-6 and S.4-1 of the Operating Manual.

Such a selection will make the AUTO TUNE to adjust the output tank for a 10% higher plate-loading resistance than it is with the NORMAL selection. This will reduce the maximum attainable output power but it will improve the plate efficiency. Also, the drive needed from the transceiver will be reduced which is an advantage for RTTY mode.

Besides, I would not recommend using ACOM2000A at an output less than 800-1000W output since the tubes regime is with a high idling current for good linearity. There is no special CW/FM mode foreseen.☐

Subject: [acom-list] Power out question??

Hello All,

I am wondering if there is any negative issue
in running the 2000A at 700 or 800 watts by
just turning down the drive from the exciter??

Thanks in advance for any info....

73,
Ted K2QMF

From: Bob Naumann
Topic: 4394 Message: 4412

OK - Ron - this makes sense.

While it may not be optimum efficiency, the default tuning of the amplifier when run at such a low input level cannot cause any real problems i.e.; damage to components etc.

Also, running at lower than maximum output on RTTY, again, perhaps the default tuning may not result in optimum efficiency, but the reduced power level will result in less stress, fatigue and heat than running at full power.

Bottom line - reduce your drive to whatever level you want, and don't worry about it.

I agree about the 100w / 150w issue - the ARRL should change the 150 to 100 and stop the madness that is inevitable.

73,

Bob W5OV

Subject: RE: [acom-list] Power out question??

My question was regarding running the 2000A at 150 watts output. I was concerned about operating the amplifier so far out of normal specified operation. Will the amplifier generate excess heat when operated in this way? Is there a low power mode, like we have in the 1010?

Why would anyone want to run the 2000A at only 150 watts output? I was preparing to operate the ARRL RTTY Roundup contest in the low power category. Most contest sponsors define low power as 100 watts, while the ARRL defines low power as 150 watts. So rather than run my transceiver at 100 watts maximum and listen to the fans scream all weekend, I was looking into running my transceiver at 10 watts, and have the amplifier loaf along at 150 watts (maximum for the low power category).

After receiving the reply from Acom, I decided to leave the amplifier off and I ran my exciter at 100 watts.

Subject: RE: [acom-list] Power out question??

This is what I received from Acom back in 2004:

☐You can tell Ron that generating much heat is normal for a linear when used
below 70% of its nominal output (150W is 7.5% from 2000W).

The heat for RTTY mode would be reduced if you make a "HIGH" selection in
the "DEF" (Defaults) sub-menu for "MAINS VOLTAGE / LOW-NORMAL-HIGH" settings
and then refresh the AUTO TUNE like this is described in sections S.5-6 and
S.4-1 of the Operating Manual.

Such a selection will make the AUTO TUNE to adjust the output tank for a 10%
higher plate-loading resistance than it is with the NORMAL selection. This
will reduce the maximum attainable output power but it will improve the
plate efficiency. Also, the drive needed from the transceiver will be
reduced which is an advantage for RTTY mode.

Besides, I would not recommend using ACOM2000A at an output less than
800-1000W output since the tubes regime is with a high idling current for
good linearity. There is no special CW/FM mode foreseen.☐

Hi Val,
Thanks for the advice. I tried the Bencher key directly into the IC-7700 front panel connector. It still gave me a pop or a chop sound but only at the end of a word. I am in the full QSK mode at about 30wpm.I could hear between the dit/dahs OK but then at the end of a word a "pop." I tried again with the Microham DK-II. It is now set for a PTT lead of 10ms and a PTT Tail: (Constant) 0ms. It sounds very good - no pops!

The little relay in the IC-7700 is louder than the vacuum relay in the 2000A!

Thanks for the information, this should make it pretty simple to add switch only control to the software.

73 James M0YOM

From: acom-list@yahoogroups.com [mailto:acom-list@yahoogroups.com] On Behalf Of Markus Schleutermann
Sent: 27 September 2011 15:44
To: acom-list@yahoogroups.com
Subject: AW: [acom-list] ACOM2000S & SW

Hello James

What I can tell you about the operation of the ACOM2000S without amplifier is the following: switch and amp have the same command sets, just the device addresses are different. We are connecting the serial interface of our webswitch to the PC-Input of the A2000S-Controller and put the slide switch on the back-panel to position "PC". This switches the RX-data line of the controller from the amp to the external command device, eg. pc or webswitch. In our case it was necessary to repeat all the commands sent from the amp and the A2000S by the webswitch to synchronize the three boxes. Before doing that, we had very sloppy feedbacks from the amp, we had to wait for more than 30 seconds until we received a feedback by the amp.
Hope that helps for the further development!

73 de Mark, HB9AZT

Von: acom-list@yahoogroups.com <mailto:acom-list%40yahoogroups.com> [mailto:acom-list@yahoogroups.com <mailto:acom-list%40yahoogroups.com>] Im Auftrag von James Thresher
Gesendet: Dienstag, 27. September 2011 13:25
An: acom-list@yahoogroups.com <mailto:acom-list%40yahoogroups.com>
Betreff: [acom-list] ACOM2000S & SW

Most of you are aware of the ACOM Director software I produced for the ACOM 2000A, in response to this I've had a number of requests recently about control software for the ACOM2000S/SW (without it being connected to the ACOM2000A)

Unfortunately I don't own these so I'm wondering if there are any UK based Hams on here that have the ACOM2000S/SW combination who may be willing to loan these out in order to try to produce the control software for them (Assuming it turns out to be possible of course)? It would at most be a couple of weeks of work.

Any software produced would of course be open source and made available for free.

Subject: [acom-list] Re: Acom 1000 Firmware

The firmware is programmed on a "classic" EPROM - 27C512 chip. The only way to upgrade it is to get the HEX/BIN file for a newer version from ACOM, erase the original chip with UV light (or just get a blank chip) and use an EPROM programmer to write the file. The firmware IC is socketed on the control board behind the front panel.
The ACOM 1000 MCU is not designed around a modern PIC with user-friendly means of flashing the firmware via USB or serial port. Updates (when really needed) are normally done by their service facilities.

Hope this helps!

If you have an older 2000A, you can connect the power to the fan full-time by re-wiring it to full-time power if you like. I think some of the older units did have both options on the little circuit board where the fan is supposed to connect.

It will be noisier if you do this and the real likelihood is that unless you're W1AW doing RTTY broadcasts, it's just not necessary.

Remember, you have the big squirrel cage fan inside the amp running all the time now.

Oh well, it wasn't the relay. Replaced with no change in symptoms. I was suspicious before as I had heard it chatter occasionally with no excitation, that has to be a control issue.

Does anyone know of common faults with the control system? Most common errors here are "relay open, should be closed" when transmitting, and arc faults that are definately not arcs. "Relay open" was intermittent, now seems to be a hard failure.

Hi,
I have had this _("Antenna relay open it should be close....."_) problem in the past time october 2010 this error was produced for one of my antennas (I do not detect before if the problem is produced for any antenna all antennas are OK) with others not appear, I ask for it ACOM Bulgaria, and say to my step to step to take measure in the internal plate all measures are OK (¿?) I think my antenna switch is damage (¿?) I check all antenna conections and swich,finally I decide to change the vacuun realy and ask for the price, but at this time I decide to make a experiment (!!!!!!!!!!!)
I build a RF choke 23,5 turns of RG 58/U (you ca make it of RG 213, but is very long the pipe) on a 110 mm diameter PVC pipe and insert THE CHOKE "between" _antenna out and antenna the switch_ the problem has not appeared at the moment and the ACOM 2000 is working 100%
I am surprised for it (¿?), mine is one of the 2000/2001 _year is 10 years old .
_Sorry for my English

Thank you for the input Ivan. RF parallel currents are not the case for my issue as I can see it with no RF output.

Thanks,
Drew K3PA

From: tomi.j.kallio@kolumbus.fi
Topic: 4373 Message: 4423

Problem solved
I have 12V extra fan, it wont spin under 90c because serial resistor is too high for my fan.
I could change it but better solution is to run extra fan with 12V power supply and use correct resistor. (40 ohm on my case)
Now extra fan help normal fan to keep amp cool.

Tube temps are around 50C on normal CW QSO with 1KW output.
If extra fan is stopped, temp is around 65 C

Cooler is always better :)

Yahoo group: acom-list (2010 — 2016)
Date: 2011-10-05 19:36:40 UTC
From: Jay Terleski
Topic: 4340 Message: 4424

Just fixed a ACOM 1000 that had the dreaded TR2B error (TR RELAY). Customer had replaced the relay to no avail, so he sent it in.

The problem was that C50 on the main board had burnt up but did not show any burnt or bulging marks looking at the top of the MAINS PCB.

I found that betwen the 48V output from that board on J5 only had 28V on it. So the VAC relay would work but not fast enouph.

Tracing back to the 48V diode bridge D22-D25 I found that it was open. Looking at the board carefully did not show where. So it had to be under the cap where the trace went. Removed the cap and found the mess.

Repaired trace, put in another electroytic and now the amp is back in business.

Don't ask me how long it took to get this far. Thanks to Stanislav in Bulgaria he gave me the info that indeed the Vac relay wants to see 48Volts DC.

So common causes of this error could be
1 VAC RELAY
2. 48V DC supply to VAC RELAY coil is bad or missing or very low as in 28V. It will still allow the relay to work but not fast.
3. 1.8V DC relay sense voltage on the VAC RELAY and the two large RFC inductors that keep RF out of the circuitry
4. CPU board and the sense line into the processor for the 1.8V DC

Hope this helps someone in the future.

Jay

4429. EBS electronic bias user update

Yahoo group: acom-list (2010 — 2016)
Date: 2011-10-18 02:53:26 UTC
From: kamarty456
Topic: 4429 Message: 4429

I did the EBS modification back in February of 2011.
You can do a search to read all the discussions etc.
I believe message # 3938 is a good starting point.
Also look in the file section for specific instructions

The purpose of this post is to simply let you all know the 2000A
is working flawlessly and has not hick-cupped or skipped a beat!

For those of you still deciding about jumping and and doing the EBS
modification, I say "go for it"

Not to be overly critical, I have heard a number of ACOM 2000A
amplifiers of various vintages and in the SSB mode I have heard
the bias crunch on certain words and syllables. Even those used with strident narrow band
SSB audio exhibited the crunch.

The crunch sounds like someone crinkling up paper or RFI

My amp is around 11 years old [how time flies!!!]

Especially for those of you using SSB fidelity [ESSB/essb]
this modification is perfect!

regards,

Martin KA7GKN

4430. Re: Fixes to allow Ten-Tec Xcvrs to work with the ACOM 2000A

There is a doc ("TenTec.doc")in the files section showing the modification to a Ten-Tec Paragon so that its TX EN and TX OUT lines comply with the Acom 2000A.

Does anybody know the corresponding rework instructions to modify an Omni6 or Omni6+ ?

Thanks & 73,
Barry N1EU

I fully agree with Marty his opinion about the excellent EBS
modification. After daily and sometimes intensive use of my 7 years old
Acom 2000A the reports I got are excellent, with noticable improvement
of my transmitted audio compared to before the modification. No problem
with extended heat or other problems.

Strongly recommended!

Topic: 4429 Message: 4434

I doubt this is an ACOM factory authorized modification.
Thus YOU must do it, and it's not difficult.

Review the EBS modification files well represented from HANS!

You do not need to get into the high voltage section of the amp.
The modification is done on the front panel control board.

The files section provides information on old and newer control
boards...photos included!

On newer boards you simply add a small jumper wire directly on
the circuit board.
On older boards you simply add a jumper wire across a resistor.

I have an older control board and added a short jumper across a resistor.

The EBS mod files explain in specific detail how to accomplish
this modification.

I believe even the newer amplifiers come factory made WITH
the electronic bias [EBS] engaged.

Hello Ron,

As far as I know all the Acom 2000A linear amplifiers standard have the EBS enabled and therefore suffer the EBS-crunch during voice transmissions. You can easily see it on the display of the RCU; when during voice transmissions you notice a variation of the BIAS between -124V, -75V and -52V, then you have the EBS enabled. After the EBS-modification the BIAS is fixed at -52V during transmit and -124V in standby.

The Voltages of course may vary a little bit, e.g. -122, -123 or -124V, depending on your mains Voltage.

Hello John,

IMHO this mod can easily be done by the end user.

From: Bob Naumann
Topic: 4443 Message: 4443

As many of you know, Array Solutions is an authorized Acom dealer here in the USA.

Recently, I have received telephone calls from potential customers asking if this "crunch" noted by "hi-fi" operators is a design flaw with the Acom 2000A.

As this modification has gotten a lot of publicity, I wanted to get the facts to make some points very clear so I posed some specific questions to Acom in Bulgaria:

****

Q: Am I correct that Acom DOES NOT recommend this procedure?

Acom: Yes

Q: If someone performs this modification do they VOID THEIR WARRANTY?

Acom: Yes

Q: I understand that these "audiophile" and "Hi-Fi" audio types think this makes a difference in their audio quality, but does it really do what they claim?
And, is what they claim a problem with the original design of the 2000A?

Acom: It is a compromise between the temperature regime and quality, such like running class AB and A for instance. Not a drawback.

****

So, please be aware that Acom does not recommend this modification, and making this modification to your amp will void the warranty.

Acom's position is that the modification is not necessary and the compromise resulting in reduced heating is a good design choice for their amplifier. If you are a "hi-fi" type of operator and this "crunch" is an issue for you, then by all means go ahead and modify your amp - but keep in mind that you will void the warranty on your amplifier by doing so.

73,

Bob W5OV
Array Solutions

This issue is not related to only "Hi-Fi Audio." The change in class as the amp steps through its tri-state bias occurs regardless of transmitted SSB bandwidth. What has happened is that certain Hi-Fi audio ops have noticed the effect more acutely than other operators. This affect is not limited to ACOM. Several amps have dynamic EBS systems although their bias points may be different.

After listening to PA1HR's before and after recordings in the Files section
(
http://groups.yahoo.com/group/acom-list/files/EBS%20and%20Bias%20crunch%20mod/),
I really think the issue bears further investigation - if Acom is unwilling
to investigate the full OTA ramifications of their bias compromise than I
guess it's on us Acom owners to do so and produce more recordings. It's
premature to label this a "hi-fi" issue and dismiss it. I would hate to
think that my tx audio is subject to the amplitude perturbations that I hear
in PA1HR's before recording.

Topic: 4443 Message: 4446

Barry,

Acom is not "unwilling" to investigate. This is a mis-characterization.

To the contrary, their statement is as I reported after fully evaluating the potential impact of this modification.

To them, this is a complete non-issue and the compromise of the bias switching is a prudent design trade-off of reducing heat.

Some people may disagree and that is their right to do so. However, characterizing this as a defect is not correct.

It is a design decision which weighs out the alternatives, and reduced heating takes priority here.

Acom's perspective is clear however, and they do not recommend that anyone make this modification to their amplifiers.

Individual amplifier owners can of course make their own decisions.

73,

Bob W5OV

Bob,

Not sure if a firmware update could handle this but if the hooks are in place, an operator could select the type of bias desired from the RCU's menu. This would eliminate any hardware mods by the user or factory, preserve warranty, etc.

Paul, W9AC

Subject: RE: [acom-list] EBS electronic bias user update - Acom comments

Barry,

Acom is not "unwilling" to investigate. This is a mis-characterization.

To the contrary, their statement is as I reported after fully evaluating the potential impact of this modification.

To them, this is a complete non-issue and the compromise of the bias switching is a prudent design trade-off of reducing heat.

Some people may disagree and that is their right to do so. However, characterizing this as a defect is not correct.

It is a design decision which weighs out the alternatives, and reduced heating takes priority here.

Acom's perspective is clear however, and they do not recommend that anyone make this modification to their amplifiers.

Individual amplifier owners can of course make their own decisions.

73,

Bob W5OV

After listening to PA1HR's before and after recordings in the Files section
(
http://groups.yahoo.com/group/acom-list/files/EBS%20and%20Bias%20crunch%20mod/),
I really think the issue bears further investigation - if Acom is unwilling

to investigate the full OTA ramifications of their bias compromise than I guess it's on us Acom owners to do so and produce more recordings. It's premature to label this a "hi-fi" issue and dismiss it. I would hate to think that my tx audio is subject to the amplitude perturbations that I hear in PA1HR's before recording.

Yes I'm aware that Array services Acom products.

This became so after I purchased my 2K which I was pleasantly surprised.

Jay and the guys at Array are easy to talk with and helpful.

I don't expect issues with my 2K but if I needed help they are 15 miles from my home yeah me !

I love my Acom and wouldn't buy anything else.

Subject: RE: [acom-list] EBS electronic bias user update - Acom comments

As many of you know, Array Solutions is an authorized Acom dealer here in the USA.

Recently, I have received telephone calls from potential customers asking if this "crunch" noted by "hi-fi" operators is a design flaw with the Acom 2000A.

As this modification has gotten a lot of publicity, I wanted to get the facts to make some points very clear so I posed some specific questions to Acom in Bulgaria:

****

Q: Am I correct that Acom DOES NOT recommend this procedure?

Acom: Yes

Q: If someone performs this modification do they VOID THEIR WARRANTY?

Acom: Yes

Q: I understand that these "audiophile" and "Hi-Fi" audio types think this makes a difference in their audio quality, but does it really do what they claim?
And, is what they claim a problem with the original design of the 2000A?

Acom: It is a compromise between the temperature regime and quality, such like running class AB and A for instance. Not a drawback.

****

So, please be aware that Acom does not recommend this modification, and making this modification to your amp will void the warranty.

Acom's position is that the modification is not necessary and the compromise resulting in reduced heating is a good design choice for their amplifier. If you are a "hi-fi" type of operator and this "crunch" is an issue for you, then by all means go ahead and modify your amp - but keep in mind that you will void the warranty on your amplifier by doing so.

73,

Bob, what I said was "If Acom is unwilling to investigate" NOT "Acom is unwilling to investigate".

If PA1HR's before recording is truly representative of the 2000A units in the field, why wouldn't there be more investigation? I think we at least need to know if we are all sounding like this or not. I think we need more OTA tests/recordings, perhaps with some guidance from Hans, Marty, and others on how to record the phenomenon (or lack thereof).

I think it's quite possible that the average 2000A displays much lower level of artifacts than in PA1HR's recording, but shouldn't we investigate and find out?

Hello Bob,

Thanks for the info.

I had some correspondence with Acom too about this item, before I did
the mod. But my 2000A was out of warranty anyway.

Yeasu never modified the keyclicks of their 1000MP series, in all these
years they were on the market. Modified MP's officially lost their
warranty too. I did the mod in all my MP's (the basic, Mark-V's (I had
two of them) and Field). I like clean signals coming from my
transceivers; CW and SSB.

I apologize if I was not clear enough.

Again, their statement is as I reported *AFTER FULLY EVALUATING* the potential impact of this modification.

To be more practical about it: How many reports of bad audio have you received from this with your amplifier?

I bet that just like me and 99.9% of the other 2000A owners out there - you have received no reports of bad audio. This is Acom's point.

Again, Acom said: "It is a compromise between the temperature regime and quality, such like running class AB and A for instance. Not a drawback".

Bottom line for me, and for Acom, this is a non-issue.

73,

Bob W5OV

Bob, what I said was "If Acom is unwilling to investigate" NOT "Acom is unwilling to investigate".

If PA1HR's before recording is truly representative of the 2000A units in the field, why wouldn't there be more investigation? I think we at least need to know if we are all sounding like this or not. I think we need more OTA tests/recordings, perhaps with some guidance from Hans, Marty, and others on how to record the phenomenon (or lack thereof).

I think it's quite possible that the average 2000A displays much lower level of artifacts than in PA1HR's recording, but shouldn't we investigate and find out?

4452. Acom 2000A and 2000SW/2000S

Yahoo group: acom-list (2010 — 2016)
Date: 2011-10-19 16:51:08 UTC
From: georgek5kg@aol.com
Topic: 4452 Message: 4452

I use my Acom 2000A with the Acom 2000SW/2000S automatic antenna switch, and have a problem. The problem is that occasionally when changing from one band to another, the switch will select the wrong antenna.

Let me paint the picture:
Tribander for 10-15-20 on position 1
40m antenna on position 2
80m antenna on position 3

The amp has been "trained" to recognize these antennas on these bands. I can QSY from band to band, and the switch will select the correct antenna.....most of the time! Occasionally, however, when changing bands, the switch will switch to an incorrect antenna. I have been investigating this problem for some time, and I cannot find any pattern of switching from one band to another that causes the incorrect switching.

When I change bands and tune the amp, I do it by changing the band on the transceiver, and hit a dit on the key, or an "uh" in the mic. If the correct antennas is selected by the switch, the amp tunes just fine. If the incorrect antenna is selected by the switch, the amp will fault off due to high vswr on the incorrect antenna (as is expected).

Here are more details. The transceiver is a K3. All antennas are resonant on their bands and do not have vswr problems. I put ferrites on the DB9 control cable from the 2000S to the amp. I do not have a computer connected to the 2000S. The shack is well grounded an free of stray RF.

I am looking for input on this problem, especially from anyone who is using a 2000A with the 2000SW/S.

Hello Bob,

The temperature regime indeed is a non-issue. After the EBS-mod I did
not notice any rise in the Acom 2000S's temperature, even not during 24
hours contesting.
My modulation however was significantly improved after the mod.

From: AB2E Darrell
Topic: 4452 Message: 4454

George,
I experience the same problem.
If you find the solution, please message me or share with the list.
I would say mine functions correctly about 90-95% of the time - it is only occasionally it picks the wrong antenna.
My combo is Icom 756 Pro III to the Acom 2000A and 2000SW/S. Low VSWR all bands.
Mine faults off exactly like yours, mainly I'm operating CW.

Hi George,

I have same setup and I don?t suffer that problem.
Where you connect the switch?

I am using Yaesu, not sure about K3, but Yaesu has a band output so I am thinking to manage the switch directly from the radio.
In this way, when you change the band in the radio, the switch will follow the radio directly, in Rx, so wont need any dit or uh, just when Tx.

About your malfunction, needs more investigation.
Perhaps you can try to monitor the switch using some software (Acom tools, Acom Director, etc)

Subject: [acom-list] Acom 2000A and 2000SW/2000S

I use my Acom 2000A with the Acom 2000SW/2000S automatic antenna switch,

and have a problem. The problem is that occasionally when changing from one

band to another, the switch will select the wrong antenna.

Let me paint the picture:

Tribander for 10-15-20 on position 1

40m antenna on position 2

80m antenna on position 3

The amp has been "trained" to recognize these antennas on these bands. I

can QSY from band to band, and the switch will select the correct

antenna.....most of the time! Occasionally, however, when changing bands, the

switch will switch to an incorrect antenna. I have been investigating

this problem for some time, and I cannot find any pattern of switching from

one band to another that causes the incorrect switching.

When I change bands and tune the amp, I do it by changing the band on the

transceiver, and hit a dit on the key, or an "uh" in the mic. If the

correct antennas is selected by the switch, the amp tunes just fine. If the incorrect antenna is selected by the switch, the amp will fault off due to high vswr on the incorrect antenna (as is expected).

Here are more details. The transceiver is a K3. All antennas are resonant on their bands and do not have vswr problems. I put ferrites on the DB9 control cable from the 2000S to the amp. I do not have a computer connected to the 2000S. The shack is well grounded an free of stray RF.

I am looking for input on this problem, especially from anyone who is using a 2000A with the 2000SW/S.

Thanks, George

Hello Maximo,

The 2000SW is connected with a DB9 cable from the 2000S to the 2000A amp.
There is no connection from the 2000S to the radio or my computer.

I have not tried to connect the switch to the K3, although there is
probably a way to do it.

I will check out the Acom software if I can find it.

Hi George,

I have same setup and I don´t suffer that problem.
Where you connect the switch?

I am using Yaesu, not sure about K3, but Yaesu has a band output so I am
thinking to manage the switch directly from the radio.
In this way, when you change the band in the radio, the switch will follow
the radio directly, in Rx, so wont need any dit or uh, just when Tx.

About your malfunction, needs more investigation.
Perhaps you can try to monitor the switch using some software (Acom tools,
Acom Director, etc)

George,
I would bet on stray RF. I run a Flex 5KA with an Acom 2KA and don't have problems with the amp but my station is automated including rotators/tuner/watt meters/keyer/logging program. RF will sneak in a cause problems from time to time. I have snap on ferrite beads on all the Acom control wires, rotator cables, serial cables and USB cables in addition to cables going to and from the Flex and the computer. Once you get over 1KW RF likes to visit the shack.

If you look up Mouser electronics on the web and order some type 31 ferrite beads and try them on the control cables it could help. They have a good selection for different cable diameters. I mostly get the .5" inside diameter beads and make a couple of wraps with the thinner cables to fill the space if necessary. Hope this helps.

From: kamarty456
Topic: 4443 Message: 4458

I apologize for stirring up a hornet's nest!

I am leaving all the replies below this as reference etc.

NOW....everyone take a breath and relax!

EBS electronic bias system has been a design characteristic in
tube amplifiers for many many years! From Ameritron to Alpha
etc.

The design is to reduce tube on time between words etc...
The rational is to have the tubes last longer, and reduce
dissipated heat....

Now ALL amplifiers using EBS demonstrate some sort of anomaly.
Most hams who simply contest or DX with the driver by QSO:
"yer 5/9 QRZ" or "yer 5/9 -257 good luck" may not observe the EBS
anomaly.

Those of you with hearing challenges may not hear the EBS anomaly.
Those of you listening very narrow 350-2400hz may not hear the
anomaly.

Many folks using tube amplifiers with an EBS circuit are unaware of
the anomaly unless told since this happens after the radio and you
will not hear it in your radio monitor.

Those of you with dirty signals...slight to considerable RFI on
your signal, AC him, room noises etc. may not be aware of the
EBS anomaly.

Many Ham's have no clue what to listen for, so your buddies in the daily rag-chew will tell you "ya sound fine like you always do"

Now.....the reality of the EBS design may cause that crunch anomaly
based upon a variety of operator styles. How you speak, how you
pronounce words, pauses between words, how you address the microphone, how much of your breathing/breath noise you
introduce etc.

EBS crunch is REAL and can be distracting!!!!!!!

The solution is very simple....if you could care less.....
IGNORE IT!

I take pride in how I represent myself on air...I speak well,
I DO NOT use "and-um, you-know, bad English, bad grammar"
and all the other poor speech styles.

To me having a pure non polluting SSB audio signal is important and I'm willing to sacrifice a few hours of tube life or additional heat for a quiet clean amplified signal.

Ameritron and Alpha have information [if asked] regarding adjusting their EBS system. For example I believe the Alpha 8410 EBS can be
adjusted via your computer interface.

The ACOM 2000A has no EBS adjustment and that's perfectly fine and not worth attacking ACOM or their design team! They also decided not
to make it an issue in their design and that's fine too!

WE have a number of options here:

1. leave the amplifier EBS system alone
2. disable the EBS system
3. install a switch to turn the EBS on/off as desired
4. calculate the time constant and adjust the resistor or
capacitor value to speed up or slow down the EBS switching time
5. attack those that do modify the EBS circuit

So for all you "design engineer experts bantering on this topic" please stop bashing ACOM!!!

Their amplifiers are beautiful machines! Stop bashing those
of us that prefer NOT to use EBS! It's our choice.

If you are so head strong regarding this EBS design or topic go send a resume to ACOM, ALPHA, AMERITON, etc and use your talent to help them redesign their amplifier EBS system....

The rest of you...go get a cup a coffee and enjoy the amplifier
and get on the air instead of hanging around all the reflectors ha!

4460. ACOM Warranties and EBS

Yahoo group: acom-list (2010 — 2016)
Date: 2011-10-21 00:53:47 UTC
From: eseniors@earthlink.net
Topic: 4460 Message: 4460

I have been following the EBS discussion with interest. Recently, some comments were posted about the impact of EBS modifications on ACOM warranties. This prompted me to relate my own experience with ACOM warranties.

About two years ago, I purchased an ACOM 1000 in a three-cornered deal involving the dealer/importer, and an impulse buyer who'd had the unit for a week. I guess you could call it "open box" at that point.

Part of the purchase arrangement was the dealer's assurance that he would honor the full warranty. Another part was his assurance that shipping risk would be covered by his commercial-strength UPS shipping insurance. (Otherwise, I would never have agreed to UPS shipping.)

Alas, when the amp arrived, it was inoperative because of UPS' shipping damage. A contributing cause was the factory omission of a component that stabilizes a vulnerable capacitor bank against shocks.

Contrary to his pre-sale assurances, the dealer did NOT cooperate in making an insurance claim for UPS' shipping damage. This was very disappointing, as I had ample proof of the damage with pre-shipping and post-shipping photographs.

However, the dealer did agree to repair the damage at his facility, if I returned the unit at my expense. I was NOT happy about being stuck with another shipping bill because of UPS' brutality, the dealer failing to honor our insurance agreement, AND a factory defect. Nevertheless, I returned it for the "warranty" repair--which I expected to be professional grade.

When the repair was done, the dealer asked me for yet another shipping fee, to return the amp to me. But ACOM websites said (and say) that their warranty covers return shipping.

At that point, I realized that my ACOM had not come with any printed warranty explaining the "fine print." So I looked for warranty details on both the dealer's website and ACOM's Bulgarian website. I could find none (and I still can't).

I then corresponded directly with ACOM in Bulgaria, and received a reply from their Export Manager. She said that ACOM's only factory warranty is an agreement between the factory and their dealer/importers as to how the factory will reimburse those DEALERS in the event of problems. She went on to say that the CUSTOMER'S warranty is whatever the DEALER decides to make it! And in this case, the dealer decided not to cover the return shipping, as promised on the websites. So "too bad, so sad," for me.

When the amp finally came back (after a couple of months of hassles and added shipping fees), I was happy to find that it worked well--as an ACOM should! But I was not so happy when I opened it up to take a look. There was a crude, functional repair that looked quite bad; and the missing factory stabilizer was still not there. Bye, bye pride of ownership--on the inside, at least.

My take-away from all this, along with 18 months of successful operating that followed, is that there's a LOT to like about ACOM products. However, their warranty coverage is vaguely specified, and inconsistently applied. As Clint might say, "Are you feeling lucky?"

So what's the relevance of all this to EBS? Well if I felt like doing the EBS mod, the Void Warranty threat wouldn't really worry me too much. I apparently never had a meaningful warranty, in the first place.

BTW, I've never had a complaint about my audio running the standard 1000. But I've also never had a compliment, which I used to get quite often with my humble old AL-80B.

73 to the group, and GoodOnYa... with or without EBS mod's.
Ed

4461. AW: [acom-list] Re: EBS electronic bias user update - Acom comments

Yahoo group: acom-list (2010 — 2016)

From: Markus Schleutermann
Topic: 4443 Message: 4461

Gentlemen

It's very simple, the EBS-Problem depends on the production lot of the amps, I have several of them out of various production lots, running in different installations on a 24/7 base, one of them had that modulation problem, others give a crystal clear modulation and don't need any mods. Did the mod on one of my installations, modulation is excellent now, temperature level is raising a little bit faster, but no problem with the aux fan, never had heat faults.

The acoms are great amps, a real masterpiece of rf-engineering (eg. have a look for the outstanding emc-design-details), except the crappy firmware which makes it difficult to write any reliable control application for the amp.

73 de Mark, HB9AZT

An: acom-list@yahoogroups.com
Betreff: [acom-list] Re: EBS electronic bias user update - Acom comments

I apologize for stirring up a hornet's nest!

I am leaving all the replies below this as reference etc.

NOW....everyone take a breath and relax!

EBS electronic bias system has been a design characteristic in
tube amplifiers for many many years! From Ameritron to Alpha
etc.

The design is to reduce tube on time between words etc...
The rational is to have the tubes last longer, and reduce
dissipated heat....

Now ALL amplifiers using EBS demonstrate some sort of anomaly.
Most hams who simply contest or DX with the driver by QSO:
"yer 5/9 QRZ" or "yer 5/9 -257 good luck" may not observe the EBS
anomaly.

Those of you with hearing challenges may not hear the EBS anomaly.
Those of you listening very narrow 350-2400hz may not hear the
anomaly.

Many folks using tube amplifiers with an EBS circuit are unaware of
the anomaly unless told since this happens after the radio and you
will not hear it in your radio monitor.

Those of you with dirty signals...slight to considerable RFI on
your signal, AC him, room noises etc. may not be aware of the
EBS anomaly.

Many Ham's have no clue what to listen for, so your buddies in the daily rag-chew will tell you "ya sound fine like you always do"

Now.....the reality of the EBS design may cause that crunch anomaly
based upon a variety of operator styles. How you speak, how you
pronounce words, pauses between words, how you address the microphone, how much of your breathing/breath noise you
introduce etc.

EBS crunch is REAL and can be distracting!!!!!!!

The solution is very simple....if you could care less.....
IGNORE IT!

I take pride in how I represent myself on air...I speak well,
I DO NOT use "and-um, you-know, bad English, bad grammar"
and all the other poor speech styles.

To me having a pure non polluting SSB audio signal is important and I'm willing to sacrifice a few hours of tube life or additional heat for a quiet clean amplified signal.

Ameritron and Alpha have information [if asked] regarding adjusting their EBS system. For example I believe the Alpha 8410 EBS can be
adjusted via your computer interface.

The ACOM 2000A has no EBS adjustment and that's perfectly fine and not worth attacking ACOM or their design team! They also decided not
to make it an issue in their design and that's fine too!

WE have a number of options here:

1. leave the amplifier EBS system alone
2. disable the EBS system
3. install a switch to turn the EBS on/off as desired
4. calculate the time constant and adjust the resistor or
capacitor value to speed up or slow down the EBS switching time
5. attack those that do modify the EBS circuit

So for all you "design engineer experts bantering on this topic" please stop bashing ACOM!!!

Their amplifiers are beautiful machines! Stop bashing those
of us that prefer NOT to use EBS! It's our choice.

If you are so head strong regarding this EBS design or topic go send a resume to ACOM, ALPHA, AMERITON, etc and use your talent to help them redesign their amplifier EBS system....

The rest of you...go get a cup a coffee and enjoy the amplifier
and get on the air instead of hanging around all the reflectors ha!

From: Barry N1EU
Topic: 4443 Message: 4462

Is it possible to "predict" whether there are EBS artifacts on your tx audio
by monitoring the BIAS voltage in the MEASURE menu as you transmit? For
example, if you see the BIAS level often transitioning from -87V to -66V
while speaking, then it probably does (does not?) mean your tx signals has
audible artifacts?

4463. LOW AIRFLOW ERROR???

Yahoo group: acom-list (2010 — 2016)

From: K0DAN
Topic: 4443 Message: 4463

Can someone tell me what the ACOM circuit logic decides to qualify as a "LOW AIRFLOW" error and trip the amp?

Recently, since 10M has been so good, I have been running 10M AM...with typically 100W to 200W carrier and I have had about a half dozen "low airflow" drops of the amp.

SWR is nearly 1:1, drive RF is only about 10W, everything is pretty nominal. I never have the "airflow" error even when running 1500W SSB. Granted, AM is a different duty cycle, but it'd seem to me 100-200W carrier is not that big a deal heat-wise. Maybe I am wrong.

I have the AUX fan on the rear and the filter is clean. The fans run when they want to. The exhaust ports above the tubes are clear and unobstructed. The amp sits on the bottom of a rack and has about 4"-5" of clearance below the next piece of equipment. Air flow in and around the rack is decent and unobstructed.

About once a year I will give myself a hernia, remove the amp from the rack, remove the HV XFRMR and carry the thing to the garage where I open the case and blow out any dust with an airhose. Usually there is some dust, but not clouds or anything you'd expect would create "low airflow".

I guess it's hernia time, just to blow out the dust and eliminate that variable....has anyone else had experience with a rack-mounted Acom, airflow, "low airflow" error, and other duty cycle issues which might have a bearing here?
Thanks and 73

My 2000A is over 6 years old, and I have never opened it up except when it was first delivered to install the transformer.

Knock on wood, I've never had a low air flow fault.

Yeah, knock on wood, and grab your abdomen!

Seriously, the Acom is sort of manageable, but it is a nut-buster, and the way mine is mounted (bottom shelf on a rack), it's a wrestling match to get the amp out of the rack, then remove the 1,000,000 screws, pull the cover, invent a way to get to bolts on the bottom of case, remove the HV transformer, and suddenly the outlook on life is a lot better.

Once the HV XFRMR is set aside, the rest of the process is not so bad.

I've had my Acom since about '99 and I regularly (annually? every 2 years?) cleaned it out....and there is ALWAYS dust in it. Nothing awful, but you can tell you're blowing junk out. The shack here is a dry basement, decent carpet in the hamshack, no animals. I suppose my area is inherently dusty, altho by no means desert.

This still doesn't answer my question about ACOM logic = "low airflow", but this thread describes the environment here.

How old is your 2000A?
There may be different generations of air blower motors.

Determine if you have proper air flow with a rough test.
take a sheet of paper and place it over the left rear corner
[facing the amp] cover the exhaust opening when the blower is starting you should see 2-3 inches of lift.

Height depends upon the weight of the paper flexibility, mains voltage, air temperature, pressure and humidity etc. the paper should cover both tube openings. Use a book to keep the paper secure..Place the book to the right of the holes say 4-5 inches so the paper has a flap and will move up when there is air movement. you may try a paper towel too.

Actually I keep tissue paper over the openings here so when power is off it drifts down to cover the openings to reduce air borne dust from settling. when I fire up the 2000A the blower lifts the tissue paper out of the way and exhausts properly.

If the lift is below about 1 1/2 inches the air flow is weak

Make sure the tube deck and tube cooling fins are clean from any dust.
Just blowing dust off the inside may not be adequate. Verify the blower squirrel cage is clean from dust and debris. You may see a counter weight or balance clamp on it..leave it alone that's for balance and is set by ACOM. Just ensure the balance clamp has not loosened.

You may have to remove the tubes to blow compressed air through the ribs [cooling fins]..Preferred method is with the tubes removed otherwise you'll just blow dust back throughout the amp.

Also check for dust and debris under the tube deck. You should have a small trap door on the bottom. Open it and gently blow out any dust or debris.

There may also be a possibility the air flow sensor needs to simply be re-calibrated/adjusted.
This is a VERY small adjustment of 2 or 3 degrees in a clockwise direction. RP1 is located under the tube deck [that small trap door]
I believe it's the pot on that circuit board and it is located almost in the center.

RP1 is a 10k pot you can see it on the schematic diagram on the intake airflow sensor With my schematics it's on page 12 of 36 but it may be on a different page in your documentation.

If you do make this adjustment you must verify the low air protection system is functioning!!! temporarily disconnect the blower power.

The "low air" message should appear reliably each time you try to power the amp. verify this three times if all is OK then reconnect the blower power.

If the adjustment does not work your air flow detector may be defective and you need to contact ACOM for a replacement sensor board.

Good luck, and please get back to us here and let us know what you did

An Ebmpapst model 4314 24 volt dc. I believe it's the actual accessory fan.

I noticed several outlets who sell this fan.

Jim, is that the internal blower or are you describing the optional external fan?

Dan is discussing a possible low air flow challenge from the internal blower.

4470. Re: [acom-list] Re: LOW AIRFLOW ERROR???

Yahoo group: acom-list (2010 — 2016)
Date: 2011-10-22 15:52:49 UTC
From: K0DAN
Topic: 4443 Message: 4470

Hi Martin...

I was just gonna send you an email on this topic (a friend sent me an archive of one of your old emails where you were having "airflow" issues)....you beat me to it!

My Acom is a very early sold in the USA ('98-'99? I think the first...it was the demo unit @ Dayton the first year FinnFet/Acom showed it to the US).

I think I installed my own aux fan...can't remember specs but has always worked OK, and even during a contest running SSB @ 1500W I don't have airflow issues. I don't operate RTTY or other full-duty-cycle modes, so don't know how the amp would do under those parameters. But if I use the amp for AM I'm typically running 100-200W of unmodulated carrier, never more than 300W (rarely). so that would be maybe 500-1000 watts PEP, 1200 PEP max, and supposedly the Acom is happy at 100% duty cycle if using aux fan. (The shack sure gets nice & toasty!)

I am curious why this errors as a "low airflow" versus "high temp" issue? How does the Acom sense airflow (I know it has a thermistor on each of the tube exhaust stacks)?

To your points:

a) I think I have enough exhaust pressure...I keep a Kleenex taped to the edge of the left-rear cabinet to keep dust from settling inside. When the amp is turned on the internal fan blows the Kleenex up vertical and there's plenty of exhaust. Once I started having this "low airflow" issue I removed the Kleenex, but no change. My sense is the exhaust flow is OK.

b) The (self installed) aux input fan I have just came with a grill but no filter, so I have added a thin 1/4" cut-up piece of vacuum cleaner filter over the fan. It does tap dirt and I wash it periodically. This could be the source of low airflow but I doubt it (amp does fine running QRO SSB and the ventilation system seems to "breathe" OK.

c) You mention adjusting "RP1" and that brings back memories. I don't remember the details, but I recognize the component, and I remember I had some type of failure under the tube trap door, and recall replacing or adjust some component(s) under there. I usually keep all my service records in my ACOM file, so will go digging there....could be this is a repeat of whatever that old issue was?!?

I think it is time to "get the hernia" and pull the Acom from the rack, wrestle with the transformer, and get inside it. (Will probably perform the EBS mod while I've got the patient's ribs cracked.) Too many variables to keep guessing on it, the first thing is a thorough cleaning and we'll see

what comes of that. Perfect timing, several contests coming up!

I appreciate your detailed response, will share the results with you when known.

Subject: [acom-list] Re: LOW AIRFLOW ERROR???

How old is your 2000A?
There may be different generations of air blower motors.

Determine if you have proper air flow with a rough test.
take a sheet of paper and place it over the left rear corner
[facing the amp] cover the exhaust opening when the blower is starting you should see 2-3 inches of lift.

Height depends upon the weight of the paper flexibility, mains voltage, air temperature, pressure and humidity etc. the paper should cover both tube openings. Use a book to keep the paper secure..Place the book to the right of the holes say 4-5 inches so the paper has a flap and will move up when there is air movement. you may try a paper towel too.

Actually I keep tissue paper over the openings here so when power is off it drifts down to cover the openings to reduce air borne dust from settling. when I fire up the 2000A the blower lifts the tissue paper out of the way and exhausts properly.

If the lift is below about 1 1/2 inches the air flow is weak

Make sure the tube deck and tube cooling fins are clean from any dust.
Just blowing dust off the inside may not be adequate. Verify the blower squirrel cage is clean from dust and debris. You may see a counter weight or balance clamp on it..leave it alone that's for balance and is set by ACOM. Just ensure the balance clamp has not loosened.

You may have to remove the tubes to blow compressed air through the ribs [cooling fins]..Preferred method is with the tubes removed otherwise you'll just blow dust back throughout the amp.

Also check for dust and debris under the tube deck. You should have a small trap door on the bottom. Open it and gently blow out any dust or debris.

There may also be a possibility the air flow sensor needs to simply be re-calibrated/adjusted.
This is a VERY small adjustment of 2 or 3 degrees in a clockwise direction.
RP1 is located under the tube deck [that small trap door]

I believe it's the pot on that circuit board and it is located almost in the center.

RP1 is a 10k pot you can see it on the schematic diagram on the intake airflow sensor With my schematics it's on page 12 of 36 but it may be on a different page in your documentation.

If you do make this adjustment you must verify the low air protection system is functioning!!! temporarily disconnect the blower power.

The "low air" message should appear reliably each time you try to power the amp. verify this three times if all is OK then reconnect the blower power.

If the adjustment does not work your air flow detector may be defective and you need to contact ACOM for a replacement sensor board.

Good luck, and please get back to us here and let us know what you did

4471. ACOM 1000 : ACTransformer OUT !

Yahoo group: acom-list (2010 — 2016)
Date: 2011-10-24 15:36:54 UTC
From: moumoumousse
Topic: 4471 Message: 4471

The AC power transformer of my ACOM 1000 is out of order ! Isolation default of high voltage ! Autoprotection:PN007

I am very surprise because it is the principal piece of an amplifier who need to be very solid. I am not a contester and don't use the amplifier in bad condition. Never use in expedition. Is there a manufacturing fault ? No for ACOM

I think that this repair of transformer is not normal and the cost of this transformer is too expensive : it is 1/4 of the price of the amplifier !!!
I had a TL922 kenwood for 20 years without any problem. Never change the transformer ! only a pair of 3-500Z in 20 years ! and my ACOM 1000 only 6 years old with this big problem of transformer, never remplace the tube.It is the original. I think of product default of this transformer. The fiability of ACOM products is not so impressive and the repair service in Bulgaria is not what we expected when the cost of some piece like this transformert is too expensive.

Reply of ACOM Bulgaria :
" you might agree that the transformer's fault is definitely not a
product default, having in mind that it worked flawless more than 6 years "

I don't consider that 6 Years of life for a transformer is normal.

How do you know that the transformer has failed?

The code only tells you that the High Voltage is not correct at power on.
It does not tell you that the transformer is bad.

Check with your dealer for advice on it.

OK - I see. The dealer did the additional work and determined that the transformer failed.

I wanted to be clear that the error code does not indicate the transformer failure, but rather that the high voltage is not within specification.

All the error codes direct a technician to the area where there is a problem - not specifically what component is causing the problem.

Hello again, fellow ACOMers -

About a week ago, I posted my experience on how ACOM warranties work (or don't work) here in the States. No one commented on my post, and that's OK. But I'm a bit puzzled, and curious: Could someone tell me whether ACOM's dealer-defined warranty system was old news to everyone (except for me). or info that no one finds interesting. or something else???

Thanks, and best regards to the group, Ed

Ed:

I bought my ACOM 2000A used, although it was only a few months old, back before Array Solutions was a factory service center. I did have one problem that turned out to be a bad solder joint on one of the circuit boards that was fixed by Will Angenent, K6ND at his office near Boston. Even though the amp was used, they still honored the warrantee. No problems since that was done about five years ago.

Hi Ed,

From what I recall of your post, you bought a "used" (week old?) unit from a dealer who gave you a warranty which is fine and perfectly normal for the retailer to hold the warranty. I found your post informative but certainly not news to me.

I recall though that this wasn't a warranty issue at all, this was the delivery service, appointed by the seller, who failed to keep the goods in the right shape and effectively trashed the amp. The dealer then repaired the amp but charged you for postage both ways.

The bottom line is that the dealer's delivery service apparently failed. Maybe the dealer didn't take out appropriate insurance? I don't know. I would have sent a few friends around to help him make his mind up but my approach doesn't suit everyone.
